This document specifies the general standards of materials and workmanship required by the Department of Infrastructure for construction of civil road network assets.
ABOUT THIS SPECIFICATION

This document was prepared by the Department of Infrastructure and specifies the general standards of materials and workmanship required by the Department for roadworks. It brings together standard terminology and methods for roadworks work across all regions of the Northern Territory.

This document is designed to be used as a reference document for roadworks projects. It is to be read in conjunction with the ‘Project Specific Requirements’ section of the Request for Tender document and the Drawings, if any. The Standards quoted are current as of July 2014.

The text has been edited to specify only the types of roadworks performed by the Department and is applicable to all regions of the Northern Territory. The text has been developed through consultation with Department of Infrastructure officers with extensive experience in civil works in the Northern Territory.

This Standard Specification will remain unchanged until an updated version is published.

Bob Pemble
Chief Engineer

29 August 2014
INFORMATION

For further information regarding this Standard Specification contact:-

Email: DocumentationServices.DoI@nt.gov.au

First Issue - October 2014
REFERENCE TEXT

REFERENCE
Read this Standard Specification in conjunction with the Project Specific Requirements and Drawings, if any. Only those parts of the Standard Specification which refer to the works being carried out apply and those items listed in the Schedule of Rates which is attached to the Response Schedules for the particular Contract. This document may be used as a blanket reference specification referring generally to the standards of materials and workmanship required by the Department for roadworks.

PROJECT SPECIFIC REQUIREMENTS
The selection of specific items or materials for the works being carried out are those items listed in the Schedule of Rates in the Response Schedules for the particular Contract and any items specified in the Project Specific Requirements section of the Request for Tender document. Any additional work or any changes to the reference specification will be specified in the Project Specific Requirements section.

PRECEDENCE
Any provision in the project specification or on the project drawings shall override any conflicting provision in this Standard Specification.

HOLD AND WITNESS POINTS
These apply whether Quality Assurance is included in this project or not. Refer to the definitions of Hold Points and Witness Points in the Miscellaneous Provisions section of this Standard Specification.

SITE COPY
Retain a copy of this document on site for the duration of the works.

COPYRIGHT
This Standard Specification is based on the Department of Infrastructure Roadworks Master Specification. This document is copyright protected and the property of the Government of the Northern Territory and must not be retained, copied, or used without authority.

1. MISCELLANEOUS PROVISIONS

1.1 STANDARDS

Conform to the following Standards, Acts and Publications unless specified otherwise:

- AS 1348 Road and traffic engineering - Glossary of terms
- AS 1742 Manual of uniform traffic control devices Set
- AS 2187.1 Explosives - Storage, transport and use - Storage
- AS 2187.2 Explosives - Storage, transport and use - Use of explosives
- NTMTM NT Materials Testing Manual
- NTCP NT Codes of Practice
- NTTM NT Test Methods
- Aboriginal Land Rights (NT) Act
- Mining Titles Act and Mining Management Act
- Workplace Health and Safety (National Uniform Legislation) Act and Regulations
- Dangerous Goods Act and Regulations
- Railways of Australia (ROA) Code - Installation of Other Parties Services and Pipelines Within Railway Boundaries
- The Water Act
- The Energy Pipelines Act (NT Gas)
- ACMA Australian Communications Media Authority - any Standards, Acts, controls specifically required. Refer to ACMA directly.

Standard Specification for Environmental Management, DoI publication

1.1.1 Standards in Conflict

Where conflict arises between a referenced standard and particular clauses of this specification the specification prevails.

1.1.2 Overseas Standards

Where no Australian Standard exists standards published by the British Standards Institute (BSI) or the American Society for Testing Materials are referenced.

1.2 DEFINITIONS

The terms used in this specification are in accordance with the definitions laid down in AS 1348 unless specified otherwise in the Definitions clauses.

- DRY DENSITY RATIO:
  The percentage ratio of the field dry density of a material to the modified maximum dry density of that material. This property is also termed Relative Compaction.
- EXTRACTION AREA:
  An excavation outside the formation limits for obtaining fill, gravel, rock and rubble. Also known as Borrow Pit.
- HOLD POINT:
  Obtain the Superintendent’s written approval for that particular part of the works.

1.3 THE CONDITIONS OF TENDER AND CONDITIONS OF CONTRACT

The Conditions of Tender and the Conditions of Contract contain additional requirements which apply to works carried out under any contract awarded by NT Government, including any works carried out using this specification.

1.4 ENVIRONMENTAL MANAGEMENT

The Standard Specification for Environmental Management applies for all construction and demolition work for building and civil works carried out by or on behalf of the Northern Territory Government. The Standard Specification for Environmental Management takes precedence over this specification. A copy of this document is available at:

1.5 ESTABLISHMENT

1.5.1 General

Allow in the tender for establishment on site, including, but not necessarily limited to, the following:

- MOBILISATION:
  Transportation and establishment on site, of all the requirements to complete the work.
- DEMOBILISATION:
  Removal and transportation from site of all temporary and construction facilities and equipment. Restoration of the site, on Practical Completion of the works, compatible with environs.
- ONGOING COSTS:
  All indirect costs associated with the contract. Provide, on request, details substantiating the amount shown in the Schedule of Rates.

1.6 PROJECT SPECIFIC REQUIREMENTS

Comply with all provisions in the PROJECT SPECIFIC REQUIREMENTS (PSRs) in the Request For Tender (RFT) or on the project drawings. Any conflicts must be advised in writing to the Superintendent for clarification.
1.7 **CAMP SITE/COMPOUND/WORKSHOP – HOLD POINT**

**Hold Point** - Obtain written permission from the owner or lessee of the land. Pay all costs associated with the use of the site(s). Maintain all facilities in good condition. Remove all facilities, unless otherwise agreed in writing with owner or lessee of land, and restore the site to a clean and tidy condition upon completion of the works. Assume all responsibility for any current and consequential damage caused to the site as a result of occupation.

1.8 **EXTRACTION AREAS AND WATER SOURCES**

1.8.1 **Extraction Areas Locations**
Borrow pits will be allowed provided that all the clearances and approvals listed in the APPROVALS FOR EXTRACTION AREAS clause in the STANDARD SPECIFICATION FOR ENVIRONMENTAL MANAGEMENT are obtained. Extraction areas are not be permitted within 125 metres of the road centreline.

1.8.2 **Administration**
Take responsibility for locating, selecting, operating and rehabilitating all borrow pits and water sources.

1.8.3 **Crushing or Screening – Hold point**
Submit the nomination of a Mine Manager to the Department of Resources and allow 14 days for assessment of the nomination and assessment of the proposed crushing or screening plant. **Hold Point** - Commence crushing or screening operations only after a Department of Resources, Mines Inspector has certified that the plant is in safe working order.

1.8.4 **Operation of Extraction Areas**

**ACCESS**
Construct only one access road to each pit. Confine all transport operations to the access road. Provide and maintain adequate road drainage.

**EXTRACTION**
Strip 100 mm minimum depth top layer throughout the area of operation. Stockpile stripped material clear of drainage courses to a maximum height of 2 m. Ensure that side slopes of sand or gravel are not steeper than one vertical to two horizontal at any time when the excavation is unattended. Remove or bury by-products of the excavation operations unless otherwise required.

**LIMIT OF EXCAVATION**
Not within 6 m of any fence line or utility service. Not within sight of road traffic. Not within 125 m of any road or railway centre line. Not within 25 m of a water course. Maximum area: 1 ha. Align the long side with the contour. Maximum width: 50 m. Maximum depth: 2 m. Leave natural vegetation strips 25 m width between pits. Stockpile cleared vegetation and subsequently spread over the surface of the extraction area. Existing pits within 125 m of a public road may be used provided:
No significant revegetation exists. Extension proceeds away from the road. Site is rehabilitated after use.

1.8.5 **Rehabilitation of Extraction Areas**
Progressively rehabilitate extraction areas. Backfill all test pits. Respread unused material and rip 0.5 m deep at 3 m spacing along the contours. Remove all rubbish and debris. Replace stockpiled topsoil and cleared vegetation uniformly over the extraction area. Batter walls at three horizontal to one vertical where excavation is less than 1 m depth, and six horizontal to one vertical where depth exceeds 1 m. Rehabilitation any access road constructed for the project.

1.8.6 **Stream Sites**
Contact Department of Land Resource Management (DLRM) prior to conducting any work in a stream site. **EXCAVATION LIMITS**
Not within 200 m upstream or downstream of any road structure, pipeline or gauging station. Not in a manner liable to cause erosion or further disturbance to the watercourse. Not within 15 m of the trunk of a tree and not under the branches of any tree. **CONDITIONS**
Leave sizeable islands to ensure groupings of trees that will withstand stream bed erosion. Maximum batter slope: Two horizontal to one vertical.

1.8.7 **Inspection**
Allow authorised personnel from DLRM to enter the site at any time.
1.8.8 Records
Provide the following details on completion:
List of areas used.
Chainages of area along the public road.
Direction and length of haul road.
Approximate volume of material removed from each site.
Provide suitable forms for such records to the Superintendent.

1.9 EXPLOSIVES – HOLD POINT
Provide evidence of the following requirements of NT WorkSafe:
Licence to carry and store explosives.
Vehicle licensed to carry explosives.
Shot Firer’s Certificate.
Inspect and record the condition of all structures and services subject to possible effect by use of explosives before and after blasting operations.

Hold Point - Obtain approval from Superintendent before commencing blasting operations.

1.10 SAFETY
Comply with the Work Health and Safety (National Uniform Legislation) Act and Regulations and any applicable Codes of Practice.

1.10.1 Safety Officer – Witness Point
Witness Point - Appoint a Safety Officer and notify the Superintendent of the officer’s name.
Ensure the Safety Officer is capable and available at all times as required by the Standards.
The Superintendent retains the right to revoke the appointment of the Safety Officer at any time, and direct that another person be appointed.

1.10.2 Safety Practice
Provide safety equipment, protective clothing and devices and first aid facilities.
Ensure that employees are instructed concerning hazards and how to avoid injury.
Observe good safety practices throughout the Contract.

1.10.3 Safety Helmets
Adhere to the requirements of the Construction Safety Act.

1.11 FENCING AND SHORING OF OPEN EXCAVATIONS
Design, construct and maintain the excavation and shoring in a safe and satisfactory condition.
Support trenches in saturated or unstable ground with close timbered shoring or similar.

1.12 WORK ON RAILWAY SITES – HOLD POINT
Comply with Work Health and Safety (N.U.L) Act and Regulations.

Carry out work within railway sites to the approval of the owner and accredited operator of the railway.
The Contractor must comply with all requirements, conditions and directions of the owners and accredited operators of the Railway pursuant to the Northern Territory Rail Safety Act, when carrying out work under the Contract within 100 metres of the Railway obtain any approvals or licences required for such work.
Comply with the terms of any current existing interface agreement for work within the railway sites.

Provide documentation detailing all interfaces between the works under the Contract and the Railway or Railway land. The Contractor must fully comply with the terms of the plan.
The contractor indemnifies in the Principal in respect of any claim made by or liability to any person arising out of:
- The performance of work on, over or near the Railway, and
- The procurement or utilisation of a Railway track possession or track isolation (including any postponement, improper use or delay in relinquishing them).

Give 14 days written notice to the owner and operator of intent to commence work and provide a work plan showing safe working conditions for the site.

Hold Point - Do not commence work until the work plan has been approved by the owner and operator of the rail system.

If work is required to be carried out within 3 metres of the actual rail line, this work must be co-ordinated through the Superintendent.

1.13 WORK IN THE VICINITY OF TRAFFIC COUNTING STATIONS – HOLD POINT
Hold Point - Prior to commencing any excavation, boring of holes, blasting, rock breaking, soil compaction or similar activity in the vicinity of traffic counter station detector loops, obtain the location of the cables from the Department of Transport, Transport Planning Division, Data Contracts Officer and pay all fees.
Follow all directions and instructions issued by the Transport Planning Division in relation to work in the vicinity of such cables.

1.14 PROJECT NOTICE BOARDS
Supply, erect and maintain Project Notice Boards, at locations nominated by the Superintendent and in accordance with the ROAD FURNITURE AND TRAFFIC CONTROL DEVICES Section, within 2 weeks of establishment on site.
Refer to PROJECT SPECIFIC REQUIREMENTS SECTION of the RFT for specific Project Noticeboard details and requirements.
1.15 LEVEL CHECKING
Check levels of subgrade and final surface at 25 m intervals.
Check levels at centre line and to edges of pavement.
Check levels of intersections and parking areas at appropriate intervals.
Check levels using an independent and competent surveyor who is eligible for membership of the Institution of Surveyors Australia or the Institution of Engineering and Mining Surveyors Australia.

1.16 LEVEL AUDITING
The Superintendent may choose to audit any level survey submitted to show conformance with the specified tolerances.
Provide an experienced survey assistant when requested by the Superintendent to assist in audit checking.

1.17 CONTROL STATION CHECK SURVEY – WITNESS POINT
Refer to the RFT Preliminary Clause SURVEYS AND SETTING OUT.
Witness Point - Where results exceed the quoted tolerance notify the Superintendent and obtain directions.

1.18 AS CONSTRUCTED INFORMATION - WITNESS POINT
Document all changes to and variations of the design as the work proceeds.
Provide amended versions of the information and drawings which reflect the as built conditions.
Provide hard copies of drawings in A3 size format and provide the drawings in CAD format in AutoCad or Microstation. Provide hard copies of text information in A4 portrait format and in Microsoft Word document electronic format.
Provide the amended information and drawings to the Superintendent progressively as the work proceeds, with or before the claim for the variation which led to the need to amend the information and drawings to accurately reflect the as built condition.
Witness Point - Before the work commences provide a proposed procedure for recording and submitting the amended drawings.
Use an independent surveyor who is eligible for membership of the Institution of Surveyors Australia or the Institution of Engineering and Mining Surveyors Australia to record the changes and variations.
2. **PROVISION FOR TRAFFIC**

### 2.1 GENERAL

Minimise obstruction and inconvenience to the public.

Ensure public safety is accommodated at all work sites.

Assume responsibility for the safe conduct of traffic through, past or around the works, 24 hours a day, from possession of the site to completion of all works, defects liability period (if any) and handover.

### 2.2 STANDARDS

Conform to the following Standards and Publications unless specified otherwise:
- AS/NZS 1906.1 Retroreflective materials
- AS 1742.3 Manual of uniform traffic control devices - Traffic control devices for works on roads.
- AS/NZS 3845 Road safety barrier systems
- AS 4191 Portable traffic signals
- AS/NZS 4360 Risk management
- NTCD A Policy for the Control of Traffic at Road Works.
- AUSTROADS Guide to Road Design
- AUSTROADS Guide to Bridge Technology
- NT WorkSafe All Relevant Bulletins

### 2.3 DEFINITIONS

**Long term:**

Applies when traffic guidance is required to operate for more than one shift irrespective of whether it is day or night,

**Short term:**

Applies when work is started and completed in one shift and the road is returned to normal conditions by the end of that shift.

**Traffic Controller:**

Person responsible for the control of traffic on public roads utilising a stop-slow bat.

### 2.4 WORKZONE TRAFFIC MANAGEMENT

#### 2.4.1 Traffic Management Personnel

All personnel engaged in the works must have a current valid NT Construction Induction White Card, or equivalent qualification recognised by WorkSafe NT.

Only persons qualified in nationally accredited units of competency in Workzone Traffic Management can be utilised for traffic management at worksites. The four levels of accreditation are:

- Workzone Traffic Supervisor (WZ3)
- Workzone Traffic Controller (WZ2)
- Workzone Traffic Management Plan Designer (WZ1)
- Escort mobile road marking operations (WZ 4)

The Superintendent may grant approval for the use of a “Trainee Traffic Controller” within the work site. Such approval will only be considered after submission of a written request. A Trainee Traffic Controller can not commence work until such approval has been granted and received in writing.

#### 2.4.2 Trainee Traffic Controller

A Trainee Traffic Controller must meet all of the following criteria:

- be an employee of the Traffic Control Provider,
- hold a valid current Australian motor vehicle driver’s licence,
- be registered with a Northern Territory Registered Training Organisation (NT RTO) to undertake the RII09 Resources and Infrastructure Industry Training Package unit of competency “RIIWHS205D Control Traffic with a STOP/SLOW Bat”,
- only work under the direct supervision of a Controller (WZ2)
- have commenced training to become a qualified Controller (WZ2) and complete all assessments of competency within 8 weeks of registration.

The direct supervision of a Trainee Traffic Controller is defined as the constant personal oversight of the work by a Workzone Traffic Controller (WZ2).

#### 2.4.3 Workzone Traffic Supervisor (WZ3)

The following prerequisites must be met to enable NT accreditation as a Traffic Supervisor (WZ3):

- hold a valid current Australian motor vehicle driver’s licence, and,
- successful completion of the RII09 Resources and Infrastructure Industry Training Package unit of competency “RIIOHS302D Implement Traffic Management Plan” (or the replacement unit of competency if and when applicable) with an NT RTO, or equivalent training course through an approved RTO from another State or Territory,
- AND successfully completed a refresher course through a NT RTO in the above unit of competency.
2.4.4 Workzone Traffic Controller (WZ2)
The following prerequisites must be met to enable NT accreditation as a Traffic Controller (WZ2):
- hold a valid current Australian motor vehicle driver’s licence, and,
- successful completion of the RII09 Resources and Infrastructure Industry Training Package unit of competency “RIIWHS205D Control Traffic with a STOP/SLOW Bat” with an NT RTO, or equivalent training course through an approved RTO from another State or Territory,
- AND successfully completed a refresher course through a NT RTO in the above unit of competency, if the certificate is over 3 years old.

2.4.5 Workzone Traffic Management Plan Designer (WZ1)
The following prerequisites must be met to enable NT accreditation as a Traffic Management Plan Designer (WZ1):
- hold a valid current Australian motor vehicle driver’s licence, and,
- successful completion of RII09 Resources and Infrastructure Industry Training Package unit of competency “RIICWD503D Prepare Workzone Traffic Management Plans”, with an NT RTO or equivalent training course through an approved RTO from another State or Territory,
- AND successful completion of a refresher course through a NT RTO in the above unit of competency, if the certificate is over 3 years old.

2.4.6 Escort Mobile Road Marking Operations (WZ 4)
The following prerequisites must be met to enable Northern Territory accreditation as an Escort mobile road marking operations (WZ 4)
- hold an Australian motor vehicle driver’s licence, and either:
  - successful completion of the RII09 Resources and Infrastructure Industry Training Package unit of competency RIICRM201D – ‘Escort mobile road marking operations’ (or the replacement unit of competency if and when applicable) training course through a Registered Training Organisation from another State or Territory AND successfully completed a bridging course through a Northern Territory Registered Training Organisation in the above unit of competency.
  - Observe Workzone Traffic Management Plan

2.4.7 NT Accreditation in Workzone Traffic Management
NT accreditation is provided by the following process:
- Completion of training course (or courses) as outlined above,
- Obtain Workzone Traffic Management ID Card from NT Motor Vehicle Registry.

2.4.8 Traffic Escort Vehicle - Resealing Works
Provide a traffic escort vehicle for all work sites where resealing works are undertaken under the contract. The vehicle must have, as a minimum, one rotating beacon light. The escort vehicle is to be the lead vehicle for traffic permitted to pass through the work site at the direction of the traffic control personnel. The escort vehicle is to control the speed of the traffic to ensure safety of road works personnel. The driver of the escort vehicle is to have adequate skills and knowledge to be able to maintain safety of the public and of the roadworks personnel.

2.5 TRAFFIC MANAGEMENT PLAN

2.5.1 Submission of Traffic Control Diagrams
Provide specific or generic Traffic Control Diagrams (TCD) per activity as required and/or as specified.
Provide amended TCDs which incorporate changes, which have been approved by the Superintendent on site, within two working days of the authorisation of the change.
For Urgent Works, advise of the generic TCD or submit the specific TCD within 2 working days.
Provide amended TCDs which incorporate changes which have been approved by the Superintendent on site within two working days of the authorisation of the change.
The Traffic Management Plan (TMP) is required to be designed by a Northern Territory accredited Traffic Management Plan Designer. Include the details of the TMP Designer’s name, accreditation number and date of expiry of accreditation on the TMP.
Design the TMP in conformance with the requirements of AS 1742 – ‘Manual of uniform traffic control devices Part 3: Traffic control devices for works on roads’. Produce the plan.
by electronic means and submit electronically to the Superintendent.
Include sufficient details on the TMP to explain the potential hazards, the assessed risks and the proposed treatments for the proposed work activities and work site which may include some or all of the following:

### 2.5.2 Project Information
- Purpose and Scope
- Project Location
- Site Constraints/Impacts
- Traffic Management Objectives and Strategies
- Principal for the Works; Principal Contractor/Design Consultant including contact details
- Responsibilities including role responsibility and authority of key personnel, management hierarchy including site representatives and contact details of the responsible personnel
- Prior approvals (if any) granted by the Road Authority with relevant reference number.

### 2.5.3 Works on Roads
- Project scope inclusive of works to be undertaken, staging of works, duration of works (work hours)
- Existing Traffic and Speed environment
- Roles and Responsibilities
- Traffic Management Responsibility Hierarchy
- Project Representatives
- Traffic Management Administration

### 2.5.4 Statutory Requirements
- Occupational Health and Safety
- Provide details on the TMP of responsibilities and authorities of all key personnel on the project including project manager, line managers (site engineers, supervisors etc), contractors and workers, safety personnel and traffic management personnel
- Requirements of personal protective equipment, plant and equipment
- Procedures for incidents or accidents

### 2.5.5 Monitoring and Measurement
- Site Inspections and Record Keeping
- TMP Auditing
- Public Feedback
- References

### 2.5.6 Management Review
- TMP Review and Improvement
- Variations to Standards and Plans
- Attention to hazards for non-motorised road users

### 2.5.7 Planning
- Risk Identification and Assessment – Critical element to identify and assess foreseeable potential hazards associated with the work activities and work site
- Legal and Other Requirements – Confirmation of use of up-to-date information and legislation
- Traffic Assessment (Vehicular Traffic)
- Volume and Composition
- Existing and Proposed Speed Zones
- Intersection Capacity
- Existing Parking Facilities
- High Wide Loads
- Public Transport
- Special Events and Other Works
- Non-motorised Road Users
- Cyclists and Pedestrians
- People with Disabilities
- School Crossings
- Site Assessment
- Access to Adjoining Properties
- Environmental Conditions
- Impact on Adjoining Road Network
- Works Programming
- Work Sequence
- Night Works
- Emergency Planning
- Consultation and Communication
- Approvals – Road, Utility and Service Authorities
- Public Notification
- Notification to Other Agencies

### 2.5.8 Implementation
- Hazard Identification, Risk Assessment and Control
- Traffic Control Diagrams
- Traffic Control Devices
- Signs
- Pavement Markings
- Variable Message Signs
- Delineation
- Temporary Speed Zones
- Emergency Arrangements
- Site Access
- Communicating TMP Requirements
2.6 AUDITS OF WORK SITE TRAFFIC MANAGEMENT

Appropriately qualified and experienced Auditing Officers from DoI Road Projects may perform random audits of traffic management at work sites as part of their daily routine duties. The Auditing Officer will hold current NT accreditation as a Traffic Management Plan Designer.

Audits undertaken will include verification of:
- The Traffic Management Plan (TMP) held on site,
- The Traffic Control Diagram(s) (TCD) held on site,
- Traffic control devices established in accordance with the Traffic Control Diagram,
- The correctness and currency of accreditation of all personnel associated with traffic management at the work site.

Where the Auditing Officer deems modifications to Traffic Management are required for reasons of public safety or safety on the work site, an Instruction to Contractor (ITC) will be issued requesting immediate correction. If modifications are deemed necessary but not urgent, corrections are to be made at the earliest practicable opportunity.

2.6.1 Non Compliance

Where personnel associated with traffic management at work sites are found not to have current accreditation to an appropriate level in Workzone Traffic Management, the Superintendent may direct the Contractor to cease work, make the site safe, and withdraw plant, equipment and personnel from the road reserve.

2.7 WORK IN RURAL AREAS – HOLD POINT

Hold Point – undertake work during daylight hours only unless approval is given by the Superintendent. Approval will only be granted in exceptional circumstances.

2.8 WORK IN BUILT UP AREAS – HOLD POINT

2.8.1 Working Times

Program work, provide and install traffic management devices/controllers, equipment, materials etc accordingly so that traffic flows are not impeded during the following hours, from Monday to Friday, excluding Public Holidays:

This table is only an example of peak traffic periods in urban areas.

Hold Point – Obtain Superintendent approval if proposing to work inside these hours.

| Table 2.8.1 Restricted work hours in built up areas |
| From | To |
| 0700 hours | to 0900 hours. |
| 1530 hours | to 1730 hours. |

Remove or cover signs or devices as appropriate to stop confusion during these hours. Further restrictions may apply should the DoI deem it appropriate to do so. Concessions to work within these hours may be approved by the Superintendent, should the need arise and the officer deems it necessary.

Do not operate construction vehicles used in conjunction with the proposed works, either SV plated or vehicles in excess of 19 metres on public roads during peak traffic times (see above, working times) or in any way impede peak traffic flow during these times. Vehicles in excess of 19 metres in length are only permitted to travel on roads designated for road trains unless an appropriate permit from the Motor Vehicle Registry has been obtained in advance of using such routes.

2.8.2 Traffic Lanes

Maintain at least 2 lanes (one in each direction) open to traffic at all times unless permitted otherwise on duplicated roads and maintain at least one lane open on two lane roads with appropriate traffic control in place accordingly. Obtain the written permission of the Superintendent if it is necessary to fully close a road.

Program works so that the closure of turning lanes is minimised.

Obtain prior written approval from the relevant Local Government or Council if traffic is to be detoured onto their road network or the proposed works affects their network/assets accordingly.

Provide a copy of all relevant approvals with the traffic management plan.

2.9 WARNING DEVICES

Take care when placing warning signs, work signs, traffic management devices, or plant and equipment within the road reserve to ensure that these do not interfere with or restrict sight lines, particularly at intersections and ensure that the devices are not obscured by trees or other objects.

Ensure that road work signs reflect the current conditions of the site. Remove or cover signs such as T1-5 (worker symbolic), temporary speed reductions and the like, when not appropriate, such as when no persons are on
site. Refer to AS/NZS 1742 for guidance on the appropriate use of these signs.

### 2.9.1 Works in Progress Signs

For proposed works which are expected to be in progress for greater than 14 days, display signs, sized 1200 x 900 mm with 100 mm high black Helvetica medium lettering on a white background displaying the following details:

- The nature of the works.
- The start and end date of the works.
- The Contractor’s business name.
- The Contractor’s business phone number.
- The Contractor’s after hours phone number.
- The name of the Traffic Management Plan supervisor.

Display these signs prominently at the extremities of all works in progress and in addition to the work signs requirement. The signs remain the property of the Contractor.

### 2.10 NT SPECIFIC DIRECTIONS FOR ROAD WORK SIGNS

#### 2.10.1 Sign erection

Refer to the DEFINITIONS clause.

Mount signs on Oz Spike posts or similar, or set in concrete in accordance with the requirement for permanent speed sign installations.

Ensure that signs are clean, free of damage and comprise of a minimum of Class 1 retroreflective material in accordance with AS/NZS1906.1.

Duplicate all temporary work signs (place on both sides of roads within the work site) on all multilane work sites, irrespective of the duration of the works, unless there is insufficient room available to do so, such as the median width being not sufficient to accommodate the signs. Where necessary, seek direction from the Superintendent where this condition cannot be complied width.

#### 2.10.2 Advance warning signs

In urban areas T1-1 (road work ahead) signs and T2-16/17 (end road work) signs at short term work sites are not mandatory, however, they may be used if deemed appropriate. Use these signs at all long term or rural work sites.

Only use T1-25 (road work on side road) signs on major or arterial roads or highways where works are being conducted on a lower hierarchy road ie. roads with lower volume or speeds that intersect with such a major or arterial road or highway. Do not use these signs on lower hierarchy roads that intersect with a major or arterial road or highway.

#### 2.10.3 Star pickets & fence droppers

Do not use star pickets for support of road work signs, bunting, flagging, fencing, etc within 9 metres of the trafficked path. Issues of sign, bunting, flagging, fencing, etc. stability can be addressed by prudent use of properly manufactured sign legs, sand bags, Oz spike posts and or fence droppers.

Do not use star pickets or any other non frangible items such as steel drums, for delineation or any other purposes within 9 metres of the edge of the trafficked lanes. Bollards, cones and flagging are appropriate alternatives.

Fence droppers may be used as sign supports or legs and bunting or flagging supports on the condition that the droppers are securely embedded into the ground and the sign, bunting or flagging is sufficiently secured to the droppers. Maintain a prudent use of end caps

---

### Table – NT Specific Directions for Road Work Signs

<table>
<thead>
<tr>
<th>Long term rural areas:</th>
<th>Place all signs a minimum 1m lateral clearance from the travelled path and a minimum of 1.5m from the lower edge of the sign to the ground.</th>
</tr>

<tr>
<td>Long term urban areas:</td>
<td>Place all signs a minimum of 2.2m from the lower edge of the sign to the ground in locations where they could be obscured by parked vehicles, vegetation or trees or may interfere with pedestrian routes. On traffic islands or medians the heights for signs shall conform to the “short term all areas” where it is deemed appropriate and only if they are not obscured by parked vehicles and if they do not interfere with pedestrian routes.</td>
</tr>
<tr>
<td>Short term all areas:</td>
<td>Display all signs prominently and place a minimum of 200 mm from the lower edge of the sign to the ground, except regulatory signs such as speed, no parking signs etc, which shall be mounted a minimum of 1.5m from the lower edge of the sign to the ground. Place all signs a minimum of 2.2m from the lower edge of the sign to the ground where they could be obscured by parked vehicles, vegetation or trees or may interfere with pedestrian routes.</td>
</tr>
</tbody>
</table>
to ensure the minimisation of any hazards to workers and the public and the specified sign heights can be achieved.

Star pickets may be used for fencing support within the work site, provided appropriate action is taken to reduce any associated hazard for workers within the site and they are not within 9 metres of the travelled path of motorists.

2.10.4 Non-standard signs – Hold Point

Hold Point - Obtain specific approval from the Superintendent before using signs not included in AS 1742.3.

2.10.5 Variable message signs (VMS)

Provide electronic variable message signs in the following situations a minimum of 2 days before any changes occur, where changed conditions and or delays are to be experienced by the general public, particularly peak hour traffic;
- At all approaches to intersections
- At approaches to detours and / or
- At approaches to major works alterations

Erect variable message signs on all approaches 7 days before “turn on” of new traffic signals.

Assume full responsibility for the safe location of the variable message signs.

Use electronic variable message signs capable of displaying a minimum text size as specified in AS1742.3 and containing at least 3 lines with a minimum of 8 characters per line.

The Superintendent may provide details of the messages to be displayed and the locations of the variable message signs.

Do not, under any circumstances, use variable message signs for private advertising, within the NT Government road reserve or visible from the NT Government road reserve without the written approval of the Superintendent.

2.10.6 Multi message signs

Do not use multi message signs.

2.10.7 Work Zone Speed Limits – Mandatory

Where work zone speed limits are being proposed to be changed, the proposed temporary speed limits must be approved by the Superintendent prior to the implementation of the proposed speed limits.

Erect speed limit signs in accordance with clause SIGN ERECTION.

All Traffic Management Practitioners must record in their Daily Diaries time, date, location photographs of each approach, of speed limit installations and removals for legal purpose. These logs are required to be sent to the DoI Permit Officer at the completion of each project or monthly for long term projects greater than 1 month, via the Roads Reception 8999 4699, or faxed to 8999 4682.

2.10.8 Temporary Speed Limits – Hold Point

Hold point - Submit temporary speed limit authorisation applications to alter speed limits to the Superintendent, 2 working days prior to the implementation of temporary speed limits, for approval under the Control of Roads Act.

Place repeater speed limit signs along the road, which has a temporary speed limit imposed, after all intersections with other roads within the speed limited area.

Design the Traffic Management Plans so that speed limits lower than the following absolute minimums are not required;

<table>
<thead>
<tr>
<th>Table – Minimum Speed Limits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Urban or built up areas.</td>
</tr>
<tr>
<td>Bridge works, when restricting traffic to one lane and only in conjunction with a stop-traffic situation. A safety barrier complying with the relevant Test Level in accordance with AS/NZS 3845 shall also be used.</td>
</tr>
<tr>
<td>All other rural works.</td>
</tr>
</tbody>
</table>

2.10.9 Road Safety Barriers

Design, install and maintain all road safety barriers used within the NT Government’s road reserve in accordance with AS 1742.3, AS/NZS 3845 and any other relevant and current Australian Standard associated with the works being proposed.

Failure to meet the requirements of the relevant and current standards may result in the project being suspended by DoI or other relevant authorities, such as NT WorkSafe, without cost to that authority until the project meets the required safety standards.

2.11 EXCAVATIONS, STOCKPILES AND GRADIENTS WITHIN WORK ZONES AND CLEAR ZONES

2.11.1 NT WorkSafe Guideline in Relation to Excavations;

Provide shoring to all trenching or excavations which are deeper than 1.5 metres and where a person is required to enter unless an engineer certifies that shoring is not required. Provide a copy of the Engineer’s certification on request.

Comply with the provisions of the Code of Practice for Excavation Work available from WorkSafe Australia. Comply with NT WorkSafe
Codes of Practice and other WorkSafe Australia Codes of Practice applicable to the works.

2.11.2 DoI requirements for excavations, stockpiles or other gradients

Comply with the following DoI requirements for excavations, stockpiles or other gradients greater than 150mm, in addition to Appendix D of AS 1742.3:2009 Protection And Delineation At Excavation Works.

Implement the minimum protection requirements in accordance with AS 1742.3 during each work day, however, if any excavations, stockpiles or other steps in gradient greater than 150 mm are to be left in place longer than one work shift or are left unattended for any period of time, during any day, overnight or weekend and adequate clearance in accordance with AS 1742.3 is not available, protect them by prudent use of approved road safety barriers, backfilling, covering and or removing from site accordingly.

2.12 TEMPORARY PAVEMENT MARKING

Where new pavement surfacing or existing pavement resurfacing is being undertaken, install temporary raised reflective pavement markers at the end of each day and prior to the loss of daylight at 24 metres maximum spacing.

If so instructed by the Superintendent, temporary line marking at the end of each day may also be required until completion of the works when the permanent line marking is reinstated.

Only use temporary raised reflective pavement markers that comply with AS 1742.3, Section 3.9 Devices For Delineating And Indicating The Travelled Path and Appendix C.

For long term road construction works where sealed detours merge into existing sealed pavements or where sealed side roads merge into sealed detours, line mark transition areas in accordance with the standard drawing for LINE MARKING, CS 1520 and in accordance with AS 1742 including the setting out of arrows, letters, numerals and chevrons.

2.12.1 Removal of Temporary Linemarking

Remove temporary line marking on completion of the works by sand blasting or other method approved by the Superintendent.

All line removal works must be carried out in such a manner as to not endanger the health, safety or amenity of employees, road users or the general public.

Carry out removal of marking is such a manner as to minimise damage to pavement surfaces. Obliterate markings so as they are no longer recognisable as marking. When arrows, letters or figures are to be removed, the removal pattern must be in the shape of a rectangle or square to minimise confusion to the motorist, particularly in wet weather and poor lighting conditions.

The removed marking and the material used to remove the marking must be contained, collected and disposed of in an environmentally acceptable manner.

2.13 TRAFFIC CONTROL – WITNESS POINT

Modify the Traffic Management Plan during the works to suit site conditions if required or requested by the nominated DoI Contact Officer.

Witness Point - The Superintendent must appraise all changes to the TMPs and TCDs prior to implementation of any changes, unless there is an urgent need for amendments to mitigate any foreseen or unforeseen hazards. In such a case, the changes may be implemented and the Superintendent advised of the changes as soon as practicable thereafter. Provide amended TMPs which incorporate changes which have been approved by the Superintendent on site within two working days of the authorisation of the change.

If an incident occurs within, adjacent to, on approach to or departure from the work site, make a photographic record of the traffic control devices, site conditions, placement of plant and equipment etc, as soon as practical after the event. Advise the Superintendent of the incident as soon as possible.

Only permit single lane operation of two way traffic when traffic is directed by accredited WZTM controllers and signs or portable traffic signals etc. are employed, dependant on the site conditions and obtaining the appropriate approvals.

Organise Police control as required, or as requested by the Northern Territory Police should the need arise.

2.14 SIDE TRACKS FOR DETOURS

2.14.1 Construction

Provide side tracks for detours when it is impractical to provide for traffic on the existing road system.

Design and construct side tracks to comply with AUSTROADS "Guide to the Geometric Design of Rural Roads" and to the minimum standards in the Table – Side Track Minimum Standards.

Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT for details on Side Track Type.
Compact top 150 mm to 95% relative compaction.
Match side tracks neatly to the existing road system.

Table – Side Track Minimum Standards

</tbody>
</table>

Provide sufficient resources to direct and assist traffic, when side tracks become restricted.

Carry out immediate remedial works when traffic is delayed by poor side track conditions or surface condition is dangerous.
Provide and maintain adequate drainage.
Sealed side tracks to be primer sealed with 7 mm aggregate as specified in the SPRAY SEALING Section.

2.14.2 Maintenance
Maintain the existing road network, and all side tracks, in use by the public.
Sealed Surfaces:
Patch and repair all surfaces. Grade and roll shoulders.

Unsealed Surfaces: Regrade and roll to maintain a comfortable riding quality at design speed.
Prevent dust nuisance by water spraying at regular intervals to keep surface moist.
Do not use waste oil as a dust suppressant.
Remove debris and rubbish.
Maintain road signs and guide posts in a clean state.

2.15 ACCESS TO ADJACENT PROPERTIES AND SIDE ROADS
Maintain access to adjacent properties and side roads at all times to a level appropriate for the type and frequency of traffic.
Provide and erect proposed and approved signs detailing alternative access, only after approval from the Superintendent is obtained.
Ensure adequate access is maintained for pedestrians and cyclists as required, including delineated access if existing paths are being closed as part of the works.

2.16 TEMPORARY PEDESTRIAN ACCESS
Conform to: AS 1742.9, AS 1742.10.
Maintain access for pedestrians, cyclists and persons with disabilities passing through and around the work site. Where existing paths have been demolished or are inaccessible or modified due to construction works, provide temporary access to a standard not less than the pre-existing or preconstruction standard. Temporary access must;
- be clearly delineated and have adequate width and height clearance,
- be smooth, free draining and free of obstructions and loose material,
- provide clear guidance where paths change direction,
- provide temporary lighting in urban areas to assist path users where existing street lighting has been removed or affected by the works,
- ensure path users are clearly visible at road crossing points to approaching traffic and plant operators on the work site.

2.17 TEMPORARY BRIDGING – HOLD POINT

Design and construct any temporary bridging in accordance with the "AUSTROADS" Bridge Design Code.

Hold Point - Obtain written approval from the Superintendent prior to commencement of any such works.

Provide and erect signage, fencing, road safety barriers and or guard railing etc to prevent accidental access to the feature being bridged.

2.18 CONTRACTOR’S PLANT AND EQUIPMENT

Provide public traffic right of way at all times unless traffic control is in use.

Keep parking and materials storage clear of trafficked areas and clear zones in accordance with the AUSTROADS “Urban Design Guide”.

Do not leave equipment or tools unattended as a hazard to the public.

Floodlight the road and area within 50 m of the site when working at night, to a ground level luminance of 10 lux minimum.

2.18.1 Rotating Beacons on Plant

Provide beacons or other vehicle mounted warning devices on the highest point of the cabin roof or superstructure of all plant and equipment and in accordance with clause 3.12 (Vehicle-Mounted Signs And Devices) of AS 1742.3 where these are being used within the road reserve. Fit beacons with a minimum of 75 watt globes. Do not use strobe lights.

Ensure that the light is operational whenever the plant or equipment is working on or within 9 metres the roadway.

Ensure that the light is visible from all approaches and not obscured by exhaust stacks, back hoe arms etc, and are not covered in dust.

Protect the lights from damage by scrub etc.

2.19 ROAD WORK ZONE LENGTH

Comply with the requirements of AS 1742.3.

2.20 TRAFFIC SIGNAL AND COUNT STATIONS

2.20.1 Traffic Signals

Prior to commencement of the works and for the duration of the works clear the work and co-ordinate with the DoI Traffic Section for the appropriate region.

This includes all works within the trafficked lanes;

- 150 meters prior to the stop line
- 50 meters past the stop line
- that affects the normal daily traffic flow at the intersection or for road reserve or median excavations greater than 150mm
- within the area defined by the traffic signal poles and associated pits
- between the traffic signal poles and associated traffic signal control cabinet

2.20.2 Traffic Count Stations

Count Stations have in-pavement detection systems installed and cutting off or closing traffic lanes can have an impact on their operation.

Prior to the commencement of work within the trafficked lanes and within 50 metres of traffic signals or within 20 metres of a count station controller, clear the work and co-ordinate for the duration of the works with the DoI Traffic Section for the appropriate region.

A map of count station locations is available from Department of Transport, Transport Infrastructure Planning, contact: (08) 8924 7531.

2.21 PORTABLE TRAFFIC SIGNALS

Use portable traffic signals complying with the requirements of AS 1742.3 and AS 4191. Complete the portable traffic signal authorisation form (available from DoI Traffic section) to seek formal approval from the Superintendent to use the proposed portable traffic signals and the proposed time settings.

Portable traffic signals are for short-term traffic control applications only. Where traffic signal control is being proposed for periods greater than 2 months in a single location, consider the installation of temporary traffic signals.

For the area under the control of portable traffic signals, limit the lengths to no more than 1150 metres. Use the time settings in the TIME SETTINGS clause as a guide for red time clearance and maximum green times. Frequently observe the prevailing traffic conditions and vehicle speeds and amend the times for the site as appropriate. Submit the changes to the Superintendent as soon as practicable thereafter.
2.21.1 **Temporary Speed Limits – Hold Point**

Impose a controlled area speed limit not exceeding 80 km/h if the portable traffic signals would otherwise be in a higher speed limit zone.

**Hold Point** - Work zone speed limits require approval from to the Superintendent prior to implementation.

2.21.2 **Sight Distance**

Maintain a sight distance on the approach to portable traffic signals of not less than 150 metres. If this cannot be achieved, use appropriate advance warning signage to advise road users in advance of the sight line obstruction of the impending traffic signals ahead.

In cases where queuing traffic is extending past the advance warning signage, install further advance warning signs and speed zone signs further in advance, to prevent collisions at the end of the queue awaiting a green light. Avoid excessive traffic queuing by use of and adjustment of, appropriate time settings on the portable traffic signals whenever possible.

2.21.3 **Time Settings**

</tr>
</tbody>
</table>

2.22 **RESTORATION**

Upon completion of works:
- Remove all temporary warning signage and other traffic control devices.
- Remove all temporary works and reinstate the areas to their original state, including the removal and disposal of seal and dragging windrows and debris back across the side track carriageway.
- Comply with the requirements of the Environmental Clearances issued by Dol, DLP and the Department of Land Resource Management (DLRM), Office of Environment Heritage and the Arts Division, Environmental Assessment Branch, for the project.
3. CLEARING, GRUBBING AND REHABILITATION

3.1 GENERAL

SPECIFICATION REFERENCE; Refer to the Standard Specification for Environmental Management and to the RFT.

BURNING; Do not light fires or burn any demolished material or vegetation either on or off the site.

3.2 CLEARING

DEMOLITION; Remove fencing, buildings, kerbing, debris, drainage structures, old road surfaces and other structures as required.

REMOVAL; Except for materials to be salvaged and retained by the Superintendent take possession of demolished materials and remove them from the site.

SALVAGED ITEMS; A list of items to be salvaged is included in the PROJECT SPECIFIC REQUIREMENTS section of the RFT

EXTENT; Clear the site only to the extent shown on the drawings and specified in this section.

ACCESS; Allow 3 metre wide cleared access ways around proposed culverts, gravel pits and stockpiles.

EXCESS CLEARING; Where excess clearing has taken place beyond that specified or shown on the drawings pay compensation for the damage and rehabilitate the areas in accordance with the Reinstatement clause.

COMPENSATION; Pay compensation (To be charged as a negative variation to the Contract) for excess clearing at the rate of $5 per square metre.

3.3 TREES TO BE RETAINED

Retain selected trees shown on the drawings or as directed.

PROTECTION; Protect from damage trees which are required to be retained. Do not remove topsoil from the areas within the dripline of the trees and keep the area free of construction equipment and materials.

DAMAGE; If a tree, which is marked to be retained, is damaged and repair work is considered impractical, or is attempted and fails, remove the tree and the root system, if so directed. Replace the tree with a tree of the same species and similar condition and size or pay compensation.

Compensation for damage to existing vegetation shall be borne by the Contractor as a negative variation to the Contract and determined as follows:

Tree valuation rate: $10 per cm. of tree circumference at a height 1 m above the ground.

Maximum valuation: $2500 per tree

Minimum valuation: $250 per tree

3.4 MULCHING

Mulch all cleared vegetative matter in mechanical brush chippers to a maximum size of 100 mm as the clearing work proceeds. Do not stockpile cleared material for later mulching.

STUMPS; Stumps and other material unsuitable for mulching may be buried in disused gravel pits during rehabilitation of the pits.

GRASSES; Do not mulch grass clods, roots or other components containing viable propagules. This material may be buried in disused gravel pits.

STOCKPILES; Stockpile mulched material on the site at a maximum height of 2m for use during reinstatement work.

URBAN AREAS; Stockpile mulch on the site for reuse and deliver surplus mulch as directed by the Superintendent (within 10 kms of the site) for use in local landscaping projects.

RURAL AREAS; Stockpile mulch on the site for reuse and power blow surplus mulch into the adjacent natural vegetated areas adjacent to the works.

3.5 STRIPPING OF TOP LAYER

EXTENT; Strip the top layer of natural material to a depth of 100 mm, for the full formation width.

Stockpile stripped material at sites within 1 km of the point of origin. Stockpile heights not to exceed 2.0 m.

Spread stripped material on areas to be landscaped and/or on road batters, following completion of earthworks.

3.6 TREATMENT OF EXISTING SEALED SURFACE

Rip the existing sealed surface.

Conform to the following:

<table>
<thead>
<tr>
<th>Table – Treatment of Existing Sealed Surface</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified Cover Over Existing Seal</td>
</tr>
<tr>
<td>Fill depth 500 mm or greater</td>
</tr>
<tr>
<td>Fill depth less than 500 mm</td>
</tr>
<tr>
<td>Pavement resheeting only</td>
</tr>
</tbody>
</table>
3.7 SCARIFYING OF EXISTING ROADS

Remove seal from site. Alternatively, demolished seal may be buried in table drains if approved by the Superintendent. Provide 200 mm cover to buried material.

Scarify, both longitudinally and laterally, for the full width of the formation by ripping to a depth of 250 mm resulting in a maximum size of demolished seal of 100mm.

Tyne spacing to be 500 mm maximum.

3.8 GRUBBING

Grub out and remove from the site all vegetation to a depth of 200 mm below subgrade surface in cut and 200 mm below natural surface under fills.

Fill grub holes and other excavations as required with standard fill material compacted to the density of the surrounding soil.

3.9 REINSTATEMENT

Reinstate any clearing undertaken during the contract to rehabilitate the area back consistent with its untouched surrounds. This includes seeding, planting, watering and other measures necessary to rehabilitate the area.

MULCH; Spread mulched material over the rehabilitated area, including batters and verges, to a uniform cover of 50 mm thickness.

DETOURS; Where detours are specified in the PROVISION FOR TRAFFIC section or otherwise agreed to, rehabilitate the detour areas in accordance with the requirements of this section.

3.10 CLEANING UP

Remove all excess fill, rubble and other debris from the site. Dispose of the materials using a legal method.
4. EARTHWORKS

4.1 STANDARDS
Conform to the following Standard and Publication unless specified otherwise:
- AS 1289 (set) Methods of testing soils for engineering purposes.
- NTTM NT Test Methods

4.2 DEFINITIONS

OFFSET DRAIN:
Also described as a Table Drain Offlet. Provides relief at regular intervals of run off concentration in Table Drain. Drains water from Table Drain away from formation for dispersal into catchments.

SUBGRADE SURFACE:
The prepared surface immediately beneath the pavement and shoulder layers. Also extends under footpaths, kerb and gutter, and surface structures.

SUBGRADE:
Top 150 mm of material below subgrade surface unless specified differently in RFT or on drawings.

UNPAVED AREAS:
those areas within the road reserve boundary which are not part of the road pavement, including any medians not paved, but excluding footpaths and vehicle access strips.

FORMATION WIDTH:
Width of cut or fill including table drain(s), and out to the points of any batters.

SURFACE FORMATION:
The formation of a road from material generally cut from the table drains.

CARRIAGEWAY:
That portion of a road for the use of vehicles including shoulders and auxiliary lanes.

4.3 EARTHWORKS IN CUT

4.3.1 Description
Operations necessary for excavation, irrespective of the type of material and subsurface conditions, including:
- working cuttings so that material meeting standard fill requirements is used for the subgrade;
- disposal of excess excavated material;
- compaction of material below the subgrade surface; and
- shaping and trimming of formation within cuttings.

4.3.2 Excess Material – Hold Point
Haul and dump and spread excess material as specified in the PROJECT SPECIFIC REQUIREMENTS section of the RFT.

Haul and dump and spread excess material:
- Not less than 125 metres from the new road centre line.
- To spoil dump sites specified. Clear site of organic material/topsoil prior to stockpiling material.

Dumped material remains the property of the Principal.
Ensure dumps shall not dam surface water and streams or damage the works or other property. Ensure dumping is not in streams.
Haul, dump and spread the materials in legally acceptable locations using legal methods.
Comply with AAPA clearances.
Comply with Environmental Management approvals, including within the road reserve.

Hold Point: Obtain approval from Superintendent prior to hauling, dumping and spreading excess material.

4.3.3 Rock in Subgrade – Hold Point

Hold point - Obtain agreement from the Superintendent to the extent of the excavation.
Excavate rock encountered in the subgrade.
Avoid forming pockets of shattered material below the level of the excavation.
Remove all loose material.
Trim the excavation to shed water.
Replace excavated material with select fill compacted to 95 per cent relative compaction.

4.3.4 Unsuitable Material Below Subgrade Surface other than Rock – Hold Point

Hold point - Obtain directions from the Superintendent before works commence.
Excavate subgrade material which does not conform to the properties of standard fill as specified.
Dry out material with excessive moisture content to achieve a moisture content which permits specified compaction.
Replace excavated material with standard fill compacted to 95% relative compaction.
Floodways: Replace unsuitable material with material conforming with the following:
Angular or broken rock, free from organic matter and lumps of clay, complying with Table – Grading - Suitable Fill Material Properties
Table – Grading - Suitable Fill Material Properties

<table>
<thead>
<tr>
<th>Properties</th>
<th>Maximum size: 100 mm.</th>

</tr>
</tbody>
</table>

4.3.5 Blasting and Overbreak
Ensure blasting is not excessive. There will be no payment for overbreak beyond the limits of excavation specified.

4.3.6 Stability of Works, Rock Cuttings
Remove all loose material and rock which has been rendered unstable.

4.4 EARTHWORKS IN FILL

4.4.1 Description
Earthworks in fill includes winning, hauling, placing and compacting material on all prepared areas including holes, pits and other depressions.

4.4.2 Preparation Prior to Filling
Subsequent to stripping of topsoil, apply a minimum of three passes with maximum mass compaction equipment.

4.4.3 Benching
Cut a bench at the toe of the lower side batter when natural surface inclines at steeper than eight horizontal to one vertical.
Ensure the bench slopes downwards towards the centre line of the road and is 3 metres wide to provide a sound key for the toe of the fill.
Terrace the existing surface where side slopes are steeper than three horizontal to one vertical to provide a key for the fill.

4.4.4 Unsuitable Material Beneath Fill – Hold point
Hold point - Obtain directions from the Superintendent before works commence.
Remove unsuitable foundation material as directed before the fill is placed.
Replace excavated material with standard fill compacted to 95% relative compaction.

4.4.5 Construction Methods
Fill by either the "Compacted Layer", "Rocky Material" or "Rock Fill" method.
Select appropriate method(s).

COMPACTED LAYER METHOD
Use where material generally does not contain cobbles, boulders or broken rock.
- Deposit and spread the material in uniform level layers to a maximum thickness of 250 mm loose measurement for the full width of fill.
- Compact each layer to the specified compaction (refer Table - Dry Density Ratios for Conformance) before placing the next layer.
- Use standard fill for the subgrade.

ROCKY MATERIAL METHOD
Use where material contains some cobbles and boulders (maximum size 600 mm) with sufficient fines for the work to be free of voids.
- Break up rocks bridging between adjacent material to prevent cavities being formed.
- Maximum rock dimension: 600 mm or one-half the height of fill at the section where the rock is placed.
- Spread material in layers approximately equal to the maximum rock size.
- Work the rocky material in each layer until it is firm and unyielding.
- Construct to the bottom of the subgrade layer.

ROCKFILL METHOD
Use where material is predominantly cobbles or boulders with insufficient fines to fill voids.
- Place and work the material until interlock is achieved.
- Advance the fill by full width construction. Side dumping shall not be undertaken. The construction face shall be concave, with the shoulder face well in advance of the centre, except when filling in swamps or soft material when the advancing face ends shall be convex.
- Rock Dimensions.
  Maximum vertical dimension: one-third of the height of fill being placed.
  Maximum horizontal dimension: one-half of the height of the fill being placed.
- Construct to 300 mm below the bottom of the subgrade layer. Within 300 mm of the bottom of the subgrade layer use the Compacted Layer Method or Rocky Material Method, with a maximum particle size of 150 mm.

4.5 FILL MATERIAL
Fill material properties specified below are typical requirements. Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT for any variations to these requirements.
4.5.1 General Fill
Use the best locally available material.
Use fill material, whether cut or borrow, that is free of organic matter and has a minimum soaked CBR at 95% MMDD of 20%, at 2.5 mm penetration, and a plasticity index between 2% and 15%.

4.5.2 Standard Fill
Conform to the following properties:

<table>
<thead>
<tr>
<th>Table – Standard Fill Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>CBR 4 day soaked at 95% MMDD at 2.5 mm penetration:</td>
</tr>
<tr>
<td>Maximum Particle Size:</td>
</tr>
<tr>
<td>Plasticity Index:</td>
</tr>
</tbody>
</table>

4.5.3 Select Fill
Select fill shall be comprised of gravel, decomposed rock or broken rock, free from organic matter and lumps of clay.
Conform to the following Grading and Properties:

<table>
<thead>
<tr>
<th>Table – Grading – Select Fill</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS Sieve (mm)</td>
</tr>
<tr>
<td>75.00</td>

</table>

4.5.4 Sand Clay Fill
Sand clay (clayey sand) may be used as an alternative to Select Fill.
Conform to the following Properties and Grading:

<table>
<thead>
<tr>
<th>Table – Sand Clay Fill Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>CBR: 4 day soaked and 95% MMDD at 2.5 mm penetration</td>

</tbody>
</table>

4.5.6 Preparation and Maintenance of Subgrade Surface
Trim surface to the compliance tolerances specified free of depressions and free draining.
Maintain and repair any damage to the prepared surface prior to placing further material.

4.7 Earthworks for Drainage
Comply with the requirements of the Standard Specification for Environmental Management.
Refer to PROJECT SPECIFIC REQUIREMENTS of the RFT

4.7.1 Stream Diversions
Excavate stream diversions as shown on the drawings.
Fill existing watercourses as shown on the drawings.
Divert streams temporarily where it is necessary for the construction of the work.
Ensure that existing waterways are not filled, altered, or diverted except where specified.

4.7.2 Levees
Construct using standard fill with a Plasticity Index of:
- 6% minimum for areas north of a line connecting Birrindudu – Dunmarra – Wollogorang.
- 3% minimum for areas on or south of a line connecting Birrindudu – Dunmarra - Wollogorang
Compact in layers not exceeding 150 mm compacted thickness.
Construct in locations, and to dimensions shown on the drawings.

4.7.3 Table Drains
Construct to the dimensions shown on the drawings.
Grade to prevent ponding of water.
Discharge into culverts, offlet drains or watercourses.
4.7.4 Table Drain Offlets

Divert table drains into offlet drains at intervals not exceeding 150m or as otherwise specified in PROJECT SPECIFIC REQUIREMENTS of the RFT.

Ensure the capacity of the offlet is not less than the capacity of the table drain, and is of similar cross section.

Align and grade offlet so that the water drains away without scour and damage to disperse as sheet flow or into natural watercourses.

4.7.5 Table Drain Blocks

Block table drains at offlets.

Construct blocks from standard fill conforming to the following requirements:

- Plasticity Index: 6% minimum. 3% minimum in areas on or south of line connecting Birrindudu - Dunmarra - Wollogorang
- Length: To extend from edge of shoulder to top of outer table drain batter.
- Width: 3 metre minimum measured parallel to the road centre line.
- Height: To edge of shoulders.
- Compaction: Layers not exceeding 150 mm compacted thickness.

4.7.6 Catch Drains

Construct catch drains prior to earthworks in cut.

- Depth: 500 mm (minimum) into solid ground.
- Gradients: Ensure free flow, prevent ponding of water, prevent scour.
- Outlets: As terrain permits construct at frequent intervals to reduce scour. Construct a block on continuous grades to divert water into culverts or drains.
- Offset: 2 m (minimum) and 4 m (maximum) beyond the edge of the cutting.

Divert the drain neatly around large rocks and trees.

4.8 WIDENING OF EXISTING FORMATION

Cut back the existing formation and pavement as shown on the drawings by not less than 150 mm on each edge to sound densely compacted material to form a uniform edge (curved or straight where applicable).

Construct the widening by cutting and filling as specified.

4.9 TRIM AND COMPACT UNPAVED AREAS

Shape, grade and compact as specified.

4.10 SURFACE FORMATION

4.10.1 General

Form the road generally with material cut from the table drains, in accordance with the typical cross section.

Allow for construction to the specified height above natural surface, either by local widening of table drains or importation of standard fill.

4.10.2 Pastoral Access Roads

For in situ pavement materials comply with the following:

- CBR 4 day soaked at 95% MMDD (2.5 mm penetration): 30 minimum.
- Maximum particle size: 37.5 mm.
- Plasticity Index: 4 - 12%.

Alternatively sheet the in situ material with 150 mm imported material complying with the above, compacted to 95% relative compaction.

4.11 BATTER PROTECTION BY GRASSING

Fill batters to have a surface layer 100 mm minimum thickness of stripped material.

4.11.1 Grassing

Refer to PROJECT SPECIFIC REQUIREMENTS of the RFT for extent of batters to be treated.

4.11.2 Seed Mixture and Fertiliser

Provide certified seed complying with the requirements in the LANDSCAPE Section.

Fertiliser to comply with the TABLE - FERTILISERS in the LANDSCAPE Section.

Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT for application rate.

4.11.3 Grass Seed Application Technique

Conform to the LANDSCAPE Section.

Fabric protection to be used for all slopes steeper than 3:1. Fabric protection may consist of using jute mesh or equivalent in conjunction with hydromulching or the use of matting.

Smooth batters.

Form drains to control stormwater and prevent erosion until batter is grassed.

Place "top layer" soil from clearing operations over the batters to a depth of 50 mm.

Apply seed mixture, fertiliser, and protection. Establish grass and keep damp by watering until flowering stage is reached.
Repair any erosion.
Reseed areas until establishment is achieved.

4.11.4 Acceptance
The minimum quality of grassing required for acceptance is;
- Establishment shall be uniform.
- Coverage rate: 98% minimum of total area.

4.12 BRIDGE FOUNDATIONS

4.12.1 Conditions
The data shown on the drawings as to the character and depths of the various strata are approximate only, and no warranty, expressed or implied, is given by the Principal that the same or similar materials will be encountered during the progress of work.
Tenderers are advised to inspect copies of the bore logs and the original core samples.
Superintendent will advise where original samples are available for inspection.

4.12.2 Excavation – Hold point
GENERAL
The extent of foundations is specified by dimension and reduced level.
Excavate to the required lines and levels.
Dispose of excess material in accordance with Excess Material in EARTHWORKS IN CUT.
PREPARATION
Inspect and record the condition of all structures and services in the adjacent area prior to using pile drivers.
Hold point - Obtain Superintendent’s agreement with inspection record of current conditions.
Cut foundation to a firm surface either stepped or roughened, as directed.
Remove loose material.
Hold point - Obtain the Superintendent’s approval for the foundation surface before placing the blinding concrete.

COFFER-DAMS SHORING AND SHEETING
Design any coffer-dams required for the execution of the works.
Construct coffer-dams to adequate height and depth and as waterproof as necessary for proper performance.
Provide adequate clearance for:
- construction of forms;
- inspection of interiors; and
- pumping from outside the forms.

Remove shoring and sheeting from inside the excavation.
Remove coffer-dams, sheeting and the like from the site when no longer required.
Do not damage the finished structure or disturb adjacent in situ material.
Remove obstructions from waterways.

4.12.3 Backfilling
Backfill the excavation up to natural surface level with excavated material or select fill.
The excavated material may be used for backfill provided it is free of wood, other organic and other extraneous or deleterious material.
Place in horizontal layers not exceeding 150 mm compacted thickness.
Compact to the density ratio specified in the table DRY DENSITY RATIOS FOR CONFORMANCE in the Conformance Testing section.
Compact using equipment that will not damage the bridge substructure.

4.13 FILL ADJACENT TO BRIDGE STRUCTURES
GENERAL
Fill includes preparation of the fill area, supply, placing and compacting fill, drainage layers and piping, disposal of unsuitable material and trimming and protection of batters.
Place select fill against structures after 14 days from date of casting or after test results confirm 70% of characteristic concrete strength achieved.
Avoid unbalanced loading on structures.
Do not operate mechanically driven vibrating rollers exceeding 1 tonne within 3 metres of the structures.

ABUTMENTS AND WINGWALLS
Prepare the area as specified.
Compact select fill in horizontal layers not exceeding 150 mm compacted thickness in areas adjacent to abutments and wing walls extending horizontally a distance equal to two times the height of the adjacent structure, or as specified.
Prevent water from ponding behind abutments and wing walls.
Provide weep holes and drain pipes as specified.

4.14 COMPACTION
Mix to a homogeneous material and compact with no compaction planes and free of cracking to conform to the Dry Density Ratios specified in the table DRY DENSITY RATIOS FOR CONFORMANCE in the CONFORMANCE TESTING section and the following:
4.15 CONFORMANCE – WITNESS POINT – HOLD POINT

4.15.1 Existing Surface Levels – Witness Point

Witness point - Obtain inspections of any disputed existing surface levels with the Superintendent prior to any stripping or earthworks operations.
Quantities are based on the existing surface levels prior to the stripping of the top layer.
Allow for suitable material to replace the stripped layer (Cut and Fill) in the items for the EARTHWORKS Section.

4.15.2 Tolerances

Finish earthworks to a smooth compacted and uniform surface within the following limits:
Formation Width: Not less than specified.
Subgrade Surface: Maximum 25 mm below and not above specified level.
Subgrade Width: Not less than specified. Extend 150 mm minimum beyond the back of kerb.
Batter: Not steeper than the specified slope.
Maximum variation at any point from specified plane of batter shall be 150 mm in earth and 300 mm in rock.
Unpaved Areas/ Table Drain Invert: Maximum 75 mm above or below specified level, free of depressions capable of ponding water. Maximum 40 mm adjacent to kerbs.

4.15.3 Proof Rolling – Witness Point – Hold point

Proof roll all areas and obtain satisfactory results before ordering conformance testing of those areas.
Hold point - submit a proof rolling procedure to the Superintendent for approval including the proposed method of preparing the areas and the extent of proof rolling.
Witness point - Give the Superintendent not less than 24 hours notice of the location and commencement time for the proof rolling.
Plant Requirements; use plant in proof rolling procedures that comply with the following requirements:
Static smooth wheeled rollers with a mass of not less than 12 tonnes and a load intensity under either the front or rear wheels of not less than 6 tonnes per metre width of wheel.
Pneumatic tyred plant with a mass of not less than 20 tonnes and with a ground contact pressure under either the front or rear wheels of not less than 450 kPa per tyre and a ground contact area of not less than .035 sq.m. per tyre.
Check areas for level tolerance and layer thickness before proof rolling.
Proof roll each layer immediately following completion of compaction. If proof rolling is carried out at a later time, water the surface and roll with the test roller prior to commencement of proof rolling.
Compliance; the proof rolling requirements are deemed to comply when an area withstands proof rolling without visible deformation or springing.
Remedial work; remove and reconstruct areas that deform or break up.

4.15.4 Conformance Testing – Hold point

Ordering procedures; refer to the CONFORMANCE TESTING section for testing requirements and test ordering procedures.

General Fill
Conformance testing will be carried out on each layer of fill.

Subgrade
Subgrade surface will be tested only when it is within level tolerance and conforms to proof rolling.
Check subgrade surface levels prior to testing.
Hold point – Obtain the Superintendent’s approval of subgrade conformance prior to placing further material.

4.16 OTHER REQUIREMENTS

Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT.
5. CONFORMANCE TESTING

5.1 GENERAL

The Contractor will be responsible for process control testing.

The Superintendent will carry out all conformance testing nominated to be the Superintendent's responsibility through Panel Period Contracts.

The Contractor will be responsible for ordering the conformance tests.

5.2 DEFINITIONS

CBR  California Bearing Ratio.

CONFORMANCE TESTING

The testing to be carried out by the Superintendent to ensure that the work complies with the contract documents.

ITP  Inspection Test Plan

NATA  National Association of Testing Authorities, Australia.

NTCP  Northern Territory Codes of Practice

NTTM  Northern Territory Test Method (and NT Materials Testing Manual)

PROCESS TESTING

The testing required to be carried out by the Contractor to ensure that the work is in accordance with the contract documents.

5.3 STANDARDS

Northern Territory Test Methods (NTTM) and NT Codes of Practice (NTCP) for materials testing are given in the Northern Territory Dol Road Projects Materials Testing Manual (NTMTM). The methods contained in the Materials Testing Manual shall take precedence over all other test methods and procedures, and are used in conjunction with relevant Australian Standards.

When testing cannot be performed to the test methods stated below, these methods may be substituted with State Road Authority test methods so testing can be performed.

The following standards are referred to in this section (see REFERENCED DOCUMENTS for full titles of Standards):

AUSTRALIAN STANDARDS

| AGPT/T131 | Softening Point of Polymer Modified Binders. |
| AGPT/T231 | Deformation Resistance of Asphalt Mixtures by the Wheel Tracking Test. |

### MAIN ROADS WESTERN AUSTRALIA, TEST METHODS.

| WA 730.1 | Bitumen Content and Aggregate Grading. |

### 5.4 SPECIFIC TESTS

Conduct field density testing using Nuclear Density Gauges in accordance with NTCP 102.1 and AS 1289.5.6.1.
Conduct CBR moulding using a compaction hammer conforming with the requirements of AS 1289.5.1.1 or AS 1289.5.2.1.

Where tests are required that are not included in the manual use the appropriate Australian Standard.

5.5 PANEL PERIOD CONTRACTORS

The Principal has in place Panel Period Contracts with NATA accredited testing companies. The Superintendent will provide a list of the Panel Period Contractors to be used for conformance testing on this contract when the contract is awarded. The Superintendent reserves the right to use other NATA accredited laboratories when panel contractors are unable to carry out specific tests.

5.6 ORDERING TESTING

When required, in accordance with the contract documents, order the conformance testing in writing directly from the Panel Period Contractors. Order all testing using the DoI Test Request Form. Include on the order the following information:

- Lot boundaries including start and finish chainages, length and width
- Type of layer
- Type of tests required
- Date and time when lot will be ready for testing

Start with the first Contractor on the list and rotate in sequence for each set of tests. Do not bypass any Panel Period Contractor on the list unless that Panel Period Contractor provides a written explanation that he is unable to carry out the required testing to the time frames listed in the Table “Testing and Reporting Completion Times”. In this instance, the written explanation must be provided to the Superintendent at the same time as the order for testing. Panel Period Contractors that are unable to carry out the required testing will be placed at the end of the rotation sequence.

5.6.1 Conformance Testing

The Superintendent will pay for all conformance testing directly to the Panel Period Contractor selected to perform the conformance tests required under this contract and nominated as the Superintendent’s responsibility.

If any tests fail to meet specification, all retesting costs will be a negative variation to the contract. Failures in bitumen tests refer to Superintendent.

When testing has been ordered and the site is not ready for testing at the time specified by the Contractor, the Contractor will bear the cost of time and travel incurred by the Panel Period Contractor and the Superintendent, where applicable.

5.6.2 Process Testing

The Contractor is responsible for the ordering up and payment for all process tests carried out.

5.7 NOTICE OF TESTING – WITNESS POINT

Give the Panel Period Contractor written notice in advance of each stage of the works requiring conformance testing, including re-testing.

Witness point - Provide the Superintendent with a copy of the order for testing simultaneously with the order being sent to the Panel Period Contractor.

Any communication with the Panel Period Contractors, other than the ordering of testing or inquiring on the timing of test results, must be forwarded through the Superintendent.

Provide the Superintendent with the results of process control testing as identified in the relevant ITP with all requests for conformance testing.

Witness point - Notify the Superintendent prior to any rework of failed lots.

5.8 TABLE - TEST FREQUENCIES, COMPLIANCE TESTING

Test frequencies as per tables;
Table – Test Frequencies for Bitumen Spray Sealing.

MC - Moisture Content; FMC – Field Moisture Content; OMC – Optimum Moisture Content; MMDD – Maximum Modified Dry Density
Irrespective of FMC all materials must be cured for a minimum of 2 hours, after preparation.
Check and report sub-base and basecourse thickness to nearest 5 mm at each modified compaction test sample site.
## 5.9 CONFORMANCE TESTING RESULTS

The Panel Period Contractor will provide interim and NATA endorsed test results to the Contractor within the following scheduled times (in working days – Monday to Friday) from the time of ordering the tests. The interim test results will comprise of final, completed test results and are not preliminary estimates. Interim test results may not be NATA endorsed.

For work in remote areas increase the testing and reporting completion times by a minimum of 2 days.

** Time for completion may be extended by each additional day required for the curing of materials and each additional overnight stay.

*** From Date of Sampling.

### 5.9.1 Conformance of Compaction for Soils

Conformance of compaction will be based on lots.

Give each lot a lot number. Number the lots using a logical system. Maintain a register of all lots and lot numbers. Include the location of each lot on the lot register. Provide a copy of the lot register to the Superintendent upon request.

Lots defined by the contractor must be clearly marked out on the construction site.

Lots of work will be selected by the Contractor, based upon:
- A lot will represent no more than one shift's production.
- A lot will be continuous and will have been brought to completion at the same time.
- A lot will be composed of essentially homogeneous material with no distinct changes in attribute values.

Each lot will be subject to conformance testing in accordance with NTCP 102.1.

Defective sections will be excluded from the lot to be tested and identified as a separate lot, and will also be subjected to lot testing.

Quality of the lot will be judged as conformance or non-conformance of each lot. This will be based on all tests conducted on the lot in accordance with NTCP 102.1.
Conformance of materials is based on samples from the finished works. When lots fail to satisfy the conformance criteria, reprocess the entire lot and resubmit for retesting. Should the lot under consideration be subdivided then each subdivision will be classed as a lot and each subdivided lot will be subject to lot testing. Non-conforming lots which are subdivided after testing will be treated as separate lots and each and every subdivided lot will be retested. Density test locations will be selected by the laboratory on a stratified random basis in accordance with NTCP 103.1. In situ density is expressed as a percentage of the Maximum Modified Dry Density. One Modified Dry Density test for each in situ density test will apply. In situ density will be determined and reported in accordance with NTCP 102.1 and relevant Australian Standards. A minimum of three tests will apply to each and every lot.

The Mean Dry Density Ratio (R) is calculated as follows:

\[ R = \frac{\sum x_i}{n} \]

\( x_i \) = an individual test result
\( n \) = the number of results in the lot.

The Characteristic Mean Dry Density Ratio (\( R_c \)) is calculated as follows:

\[ R_c = R - k \times s \]

where:
\( R \) = the mean dry density ratio for the lot
\( k \) = the multiplier in the TABLE. – MULTIPLIER VALUES FOR SOILS.
\( s \) = the standard deviation.

The Standard Deviation (s) is calculated as follows:

\[ s = \sqrt{\frac{\sum (x_i - R)^2}{(n-1)}} \]

where:
\( x_i \) = an individual test result
\( R \) = the mean of \( n \) results
\( N \) = the number of test results in the lot.

When less than six tests are used to determine conformance of a lot the Mean Dry Density Ratios in the table DRY DENSITY RATIOS FOR CONFORMANCE, COLUMN A apply. When six or more tests are used to determine conformance of a lot the Characteristic Mean Dry Density Ratios in the table DRY DENSITY RATIOS FOR CONFORMANCE, COLUMN B, apply.
### Table – Dry Density Ratios for Conformance

5.9.3 Conformance of Compaction for Asphalt

Relative compaction (R) is the percentage ratio of the in situ density of the compacted asphalt and the reference density of the asphalt for a particular lot. The reference density will be the mean of the maximum density measurements determined from the asphalt testing for a particular lot.

The Characteristic Value of Relative Compaction (Rc) is calculated as follows:

\[ R_c = R - k \times s \]

where:
- \( R \) = the mean dry density ratio for the lot
- \( k \) = the multiplier in table Multiplier Values for Asphalt.
- \( s \) = the standard deviation.

The Standard Deviation (s) is calculated as follows:

\[ s = \sqrt{\frac{\sum (x_i - R)^2}{n-1}} \]

where:
- \( x_i \) = an individual test result
- \( R \) = the mean of n results
- \( n \) = the number of test results in the lot.

5.9.4 Table – Multiplier Values for Asphalt

<table>
<thead>
<tr>

<tr>
<td>10</td>
<td>0.828</td>
</tr>
</tbody>
</table>

The work represented by a lot will be assessed as the characteristic value of in situ air voids where:

Characteristic Value of Air Voids (%) = 100 – Rc
6. PAVEMENTS AND SHOULDERS

6.1 STANDARDS

Conform to the following Standards and Publication unless specified otherwise:

- AS 1141 Methods for sampling and testing aggregates.
- AS 1289 Methods of testing soils for engineering purposes.

6.2 DEFINITIONS

**BASE (BASE COURSE):**
That upper-most layer of constructed material immediately above the subgrade or sub-base and below the pavement surface (sealed or unsealed) extending for the full width of the pavement and shoulder.

**PAVEMENT:**
That portion of a road constructed for the structural support of, and to form the running surface, for traffic.

The pavement structure refers to the pavement layers, in combination, above the subgrade surface, to support the traffic loadings. May be sealed or unsealed. Excludes the shoulders.

**SHOULDER:**
That layer of material immediately above the sub-base or subgrade and adjacent to the pavement. May be sealed or unsealed.

**SUB-BASE:**
One or more layers of material placed over the subgrade and below the basecourse extending for the full width of the pavement and shoulder.

6.3 MATERIAL PROPERTIES

6.3.1 Natural Gravel

Obtain natural gravel from sources of naturally occurring deposits.

Produce required properties by crushing, screening, mixing or other processes necessary.

Ensure particles are tough, durable and of a tightly binding nature free of organic or other deleterious materials.

Conform to the tables NATURAL GRAVEL PARTICLE SIZES and NATURAL GRAVEL PROPERTIES in the finished condition.

Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT for conformance requirements.

Generally Type 2 or Type 3 for Base (Sealed/Unsealed), Type 1, Type 2, Type 3 or Type 4 for Sub-base, and Type 3 for Shoulder Material.

6.3.4 Fine Crushed Rock

Manufacture from hard rock quarry operations by crushing clean, hard, durable rock free from natural gravel, clay, loam or other deleterious substances.

Conform to the tables FINE CRUSHED ROCK PARTICLE SIZES and FINE CRUSHED ROCK PROPERTIES in the finished condition.

Refer to PROJECT SPECIFIC REQUIREMENTS in the RFT.

6.3.5 Table – Fine Crushed Rock Particle Sizes

</table>
6.3.7 Blends of Natural Gravel and Fine Crushed Rock

Not permitted in urban areas for sealed pavements.
Conform to the tables NATURAL GRAVEL PARTICLE SIZES and NATURAL GRAVEL PROPERTIES in the finished condition.
Use for heavily trafficked situations and where material is available
Refer to PROJECT SPECIFIC REQUIREMENTS in the RFT.

6.3.8 Sand Clay

Use when it forms an integral part of the pavement and/or shoulder design.
Obtain Sand Clay from sources of naturally occurring deposits.
Produce required properties by screening, mixing or other processes necessary, to produce a material of a tightly bound nature, free of organic or other deleterious materials.
Conform to the following requirements in the finished condition:

PARTICLE SIZE DISTRIBUTION

6.4 CONSTRUCTION

6.4.1 Process Control Testing – Hold Point

Hold Point: provide the Superintendent with a program and procedure for process control testing for the project within 14 days of the awarding of the contract and before work is commenced on site. Base the process control testing on lots and comply with the clause

CONFORMANCE OF COMPACTION OF SOILS.
Include the following activities, as applicable:

− Extraction Area (Borrow Pit) investigative sampling, on a grid basis
− Extraction Area (Borrow Pit) confirmatory sampling, on a windrow/stockpile basis
− On-formation testing, on a lot basis.
Include the following elements of the work in the process control testing program as applicable:
− Fill
− Sub-grade
− Sub-base
− Base course
− Shoulders
− Stabilisation
Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT.
Rework and retest failed lots a maximum of two times subsequent to an initial test failure.
Following a third test failure rip up, remove and replace the entire failed layer before carrying out any further testing.
Where relevant, provide additional process control testing procedures for concrete, bitumen and other elements subject to conformance testing by the Superintendent.
The Contractor is responsible for the ordering up and payment of all process testing costs.
Refer to the CONFORMANCE TESTING clauses in the MEASUREMENT AND PAYMENT section.

6.4.2 Production of Natural Gravel and Sand Clay Materials

Extraction Area (Borrow Pit)
Work extraction areas (borrow pits) to achieve conforming material. Control depth of winning to avoid contamination of gravel by clay and other fine materials.
Use front-end loaders or dozers to win, push up and windrow materials. Use of other plant requires approval from Superintendent.
Screen, blend and condition materials to achieve specified material property requirements.

6.4.3 On-formation Mixing and Placing

Place material in uniform layers over subgrade surface or lower layers of the pavement.
Remove segregated and contaminated material from the site.
Remove organic materials such as timber, branches, roots and the like by manual stick methods.
Do not place material on a previous layer that has:
- become waterlogged or cracked; and/or
- otherwise deteriorated.
Mix the material uniformly throughout with water to achieve a moisture content within 2% of the optimum for the specified conforming Dry Density Ratio.
Ensure water is clean and free from oil, alkali, organic or any other deleterious substances, and that the total soluble salts content is less than 3,000 mg/litre (total dissolved salts).
Provide evidence of construction water salt content level.

6.4.4 Compaction
Compact in uniform layers not less than 100 mm nor greater than 200 mm compacted thickness.
Achieve a homogeneous mass with no compaction planes.
Conform to the Dry Density Ratios specified in the table DRY DENSITY RATIOS FOR CONFORMANCE in the CONFORMANCE TESTING section.

6.4.5 Final Pavement Surface
Final pavement layers must be in a homogeneous, uniformly bonded condition free from layering, cracking, disintegration or surface tearing.
The finished pavement layer must be dense, even textured and tightly bonded, free of laminations and roller indentations. The pavement layer must retain these characteristics after rotary brooming and be suitable to receive bituminous surfacing.
Allow the top 75 mm of the pavement layer to dry back to a Moisture Ratio (Rm) equal or less than 65% for FCR and 70% for natural gravel.
Moisture Ratio (Rm) is defined as follows:

\[ Rm = \frac{(100 \times wf)}{wr} \]

where:
- Rm = Moisture Ratio, in percent
- wf = field moisture content, in percent
- wr = adjusted optimum moisture content, in percent.
The Superintendent will carry out all testing to determine the Moisture Ratio.
Remove sticks and any loose material.
Ensure surface is free of cracking.

Do not introduce new material to the surface after final compaction.
Where pavement thickness is 200 mm or greater, scarify to not less than 100 mm depth and recompact where finish not achieved.
Where pavement thickness is less than 200 mm scarify and recompact to full depth where finish not achieved.

6.5 RECONSTRUCTION AND REHABILITATION OF EXISTING PAVEMENTS
6.5.1 Widening
Saw cut back the existing pavement by not less than 150 mm width on each edge to sound material.
Excavate boxing for widening to the required depth below finished surface.
Construct subgrade as specified in the EARTHWORKS section.
Construct pavement and shoulder as specified.

6.5.2 Strengthening by Granular Overlay on Existing Pavement
This clause is not applicable to pavements which are not sealed.
Saw cut across existing pavement at each end of work. Cut shall be vertical and at least 100 mm deep to allow smooth transition to new work.
If sealed, remove seal from existing pavement.
Scarify local high spots to 75 mm below finished surface.
Construct a strengthening layer over the full width of the existing pavement and shoulder and the widening as specified.

6.5.3 Strengthening by Granular Overlay on Re-worked Existing Sealed Pavement
This clause is not applicable to pavements which are not sealed.
Saw cut across existing pavement at each end of work. Cut shall be vertical and at least 100 mm deep to allow smooth transition to new work.
Cut and/or add top-up gravel where required to achieve levels and gradelines.
Wet mix existing seal into existing base layer, with pulveriser-mixing plant, to nominal depth specified.
Moisture condition and compact re-worked existing pavement to the Dry Density Ratios specified in the table DRY DENSITY RATIOS FOR CONFORMANCE in the Conformance Testing Section for sub-base requirements.
Construct a new strengthening basecourse layer over the full width of the re-worked pavement and shoulder, and any widening, to thickness specified. Moisture condition and compact pavement to the Dry Density Ratios specified in the table DRY DENSITY RATIOS FOR CONFORMANCE in the Conformance Testing Section for sealed base course requirements.

6.6 SUPPLY TO STOCKPILE

Comply with the following stockpile requirements;
- Clear the site.
- Ensure the area is free draining.
- Spread and compact a 75 mm thick layer of sub-base gravel to 95% relative compaction.
- Trim stockpile to a uniform shape for ease of measurement.

6.7 CONFORMANCE

6.7.1 Tolerances

Refer MISCELLANEOUS PROVISIONS, Level Checking and Level Auditing.

Final surfaces shall conform to the following:

Level:
- Kerbed or Asphalt: 0 mm to +10 mm.
- Otherwise: -20 mm to +20 mm.

Straight Edge Deviation:
- maximum 5 mm in 3 m.

Compacted Thickness:
- not less than specified.

Width:
- not less than specified.

Sub-base Surface Level:
- not higher than specified.

Surface Roughness at 80 km/h:
- 50 counts/km - maximum.

6.7.2 Proof Rolling – Hold Point – Witness Point

Proof roll all areas and obtain satisfactory results before ordering conformance testing of those areas.

Hold point; submit a proof rolling procedure to the Superintendent for approval including the method of preparing an area and the extent of proof rolling.

Witness point; Give the Superintendent not less than 24 hours notice of the location and commencement time for the proof rolling.

Plant Requirements; use plant in proof rolling procedures that comply with the following requirements:
- Static smooth wheeled rollers with a mass of not less than 12 tonnes and a load intensity under either the front or rear wheels of not less than 6 tonnes per metre width of wheel.
- Pneumatic tyred plant with a mass of not less than 20 tonnes and with a ground contact pressure under either the front or rear wheels of not less than 450 kPa per tyre and a ground contact area of not less than 0.035 m² per tyre.

Check areas for level tolerance and layer thickness before proof rolling.

Proof roll each layer immediately following completion of compaction. If proof rolling is carried out at a later time, water the surface and roll with the test roller prior to commencement of proof rolling.

Compliance; the proof rolling requirements are deemed to comply when an area withstands proof rolling without visible deformation or springing.

Remedial work; remove and reconstruct areas that deform or break up.

6.7.3 Conformance Testing – Hold Point

Ordering procedures; refer to the CONFORMANCE TESTING section for testing requirements and test ordering procedures.

Only the finished compacted base, sub-base and shoulder conforming to proof rolling, level tolerance and layer thickness will be tested.

Pavements and shoulders will be considered as separate lots.

Hold point – obtain the Superintendent’s approval for pavement conformance prior to any surfacing work.

Backfill and compact all test holes with cement stabilised quality material which is the same as the layer being tested.

6.7.4 Ride Quality

Surface Roughness: IRI less than 2.4.

Ride quality requirements represent an absolute upper limit and all field values to be less than value specified.

Lotting and averaging out of field values not permitted.

Rectify all areas where Surface Roughness exceeds specified level.
7. STABILISATION

7.1 STANDARDS
Conform to the following Standards and Publication unless specified otherwise:
- AS 1141 Methods for sampling and testing aggregates.
- AS 1160 Bitumen emulsions for construction and maintenance of pavements.
- AS 1289 Method of testing soils for engineering purposes.
- AS 1478 Chemical admixtures for use in concrete.
- AS 1672.1 Limes and lime stones - Limes for building.
- AS 2157 Cutback bitumen.
- AS 3972 Portland and blended cements.

7.2 DEFINITIONS
OPTIMUM MOISTURE CONTENT:
The amount of water by mass, expressed as a percentage of the dry mass of the material, at which maximum modified dry density is obtained with the stabiliser added.

7.3 MATERIALS
7.3.1 Stabiliser
Lime: Hydrated Ca(OH)2 or Quicklime CaO conforming with AS 1672.1.
Do not use dolomite limes (Calcium Oxide or Magnesium Oxide). Do not use agricultural lime (Calcium Carbonate).
Cement: Type GP or GB.
Supply and store in a manner that protects against the weather and moisture.

7.3.2 Additives
Follow manufacturer's recommendations when using retarders and water reducing additives.

7.3.3 Water
Ensure water is clean and free from oil, alkali, organic matter and other deleterious substances, and that the total soluble salts content is less than 3,000 mg/litre (total dissolved salts).
For Southern Regions amend the maximum salt content as instructed by the Superintendent.

7.3.4 Curing Agent
Surface applied curing membrane other than the use of water to be either:
- Bitumen emulsion ARS Grade 320.
- Cut-back bitumen Class AMC 2 or AMC 3.

7.3.5 Materials to be Stabilised
Refer to PROJECT SPECIFIC REQUIREMENTS section for details of materials to be stabilised.

7.4 IN SITU STABILISATION
7.4.1 Preliminary Trial
Preliminary trial only for projects greater than 1000m2 in treated area.
Locate trial section within the works area.
Carry out a preliminary trial of the proposed operation to determine:
- effectiveness of mechanical plant;
- passes necessary to achieve the specified mixing;
- optimum curing time between preliminary and final mixing (lime stabiliser only); and
- field moisture content and plant pattern to achieve final compaction.
- Carry out all necessary process control testing for this purpose.
Conform to Dry Density Ratios specified in the table Dry Density Ratios For Conformance in CONFORMANCE TESTING.

7.4.2 Preparation of Layer
Scarify existing pavement sections and new material, where necessary, full depth before spreading.
Tyne the surface lightly when quicklime is used.
Compact lightly to reveal irregularities in the spread material and to permit the stabilising equipment to traverse the area without excessive displacement of the surface.
Shape and trim the surface to the alignment, levels and cross-sections necessary to produce the final levels and compacted thickness.

7.4.3 Commencement and Continuity of Work
Complete full width stabilisation in one day.
Cease stabilising during the following conditions:
- Wet weather or if rain is likely to fall.
- Windy periods which could cause loss of stabiliser, or dust nuisance.

7.4.4 Spreading – Hold Point
Select spread rate to achieve an unconfined compressive strength of 1.5 to 2.0 MPa.
Calibrate and check spread rate prior to commencement.

Adopt the following rate for tender purposes:
- Cement: 6 kg/m².
- Hydrated Lime: 8 kg/m².

**Hold point** - Assess spread rate based upon test results of materials to be stabilised. Obtain the Superintendent's approval of the spread rate.

**QUICKLIME**

Water the spread material sufficiently to allow full slaking.

Avoid overwatering.

**LIME SLURRY**

Initial mixing in separate paddle mixer or similar.

Use mechanical sprayer with agitation to maintain a lime/water ratio within ±10% of initial ratio.

Lime/water ratio: Generally between 1:2 (i.e. 1 tonne per 2000 litres) and 1:0.8 (i.e. 1 tonne per 800 litres), measured by mass.

### 7.4.5 Mixing

Use plant capable of:
- mixing the stabiliser with the nominated material uniformly over the full depth to be stabilised; and
- adding water uniformly to the materials while mixing with application rate between 0 to 10% (by mass) of the material being mixed.

Resultant mix to be uniform in colour and free of lenses, pockets or clumps of stabiliser.

Pulverise clayey material until at least 90% passes 19 mm sieve.

Add water to the materials during mixing to achieve a moisture content suitable for compaction.

**CEMENT STABILISATION**

Commence compaction and finishing immediately following satisfactory mixing.

**LIME STABILISATION**

Shape the treated layer to the approximate section after satisfactory mixing and lightly compact.

Cure for a period of 24 to 72 hours.

Commence final mixing.

Add water during final mixing if necessary to achieve moisture content suitable for compaction.

Resultant mix to be uniform in colour and free of lenses, pockets or clumps of lime.

### 7.4.6 Compaction

Compact parallel to the centre line of the pavement and for the full depth of the stabilised layer.

Commence compaction at the lower edge of the pavement and work progressively towards the crown or the higher edge.

Allow for progressive and uniform overlap between passes.

Wet the surface lightly after compaction to reduce moisture loss and lay the dust when necessary.

**CEMENT STABILISATION**

Complete the compacting and finishing within two hours of adding water.

### 7.4.7 Finishing

Final surface shall be smooth, dense, closely knit, free from compaction planes and cracks and finished to the tolerances specified.

Filling or addition of material to the surface of the pavement to meet tolerance requirements will not be permitted.

Maintain the surface material at not less than its specified optimum moisture content during all finishing operations.

Reconstruct non-complying areas at no cost to the Principal.

### 7.4.8 Construction Joints

**LONGITUDINAL JOINTS**

Minimise longitudinal joints by stabilising the full width of traffic lanes or wider as one continuous operation.

Joints to be straight or follow road curvature as appropriate.

**TRANSVERSE JOINTS**

Form joints following any break in excess of two hours in the continuity of the stabilisation operations.

Cut the end of the material to a plane face at an angle not exceeding 45 degrees from the vertical.

Check the surface adjacent to the joint with a straight edge prior to recommencement and further cut back the joint as necessary to achieve surface tolerance.

### 7.4.9 Curing

Keep the finished surface damp (without leaching) until further construction or curing operations are carried out.

Alternatively cure by applying a bitumen emulsion or a bitumen primer as specified.

Apply the bituminous curing membrane as soon as possible after mixing and compaction but no
later than 24 hours after relative compaction results are available.

Application rate for bitumen emulsions to be 0.3 to 0.45 litres per square metre.

Maintain clear of vehicular traffic for four days.

7.5 PLANT MIX STABILISATION

7.5.1 Stabiliser Content – Hold Point

Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT for cement content percentage rate to be used for tender purposes.

**Hold point** - Assess the cement content based upon test results of materials to be stabilised. Obtain the Superintendent's approval for the cement content.

7.5.2 Preliminary Trial

For projects over 1000m² in treated area.

Locate trial section within the works area.

Carry out a preliminary trial of the proposed operation to determine:
- effectiveness of mechanical plant; and
- field moisture content and plant pattern to achieve final compaction.

Test stabilised material for conformance to the table Dry Density Ratios For Conformance in CONFORMANCE TESTING.

7.5.3 Commencement and Continuity of Work

Complete full width stabilisation of pavement in one day.

Do not stabilise during wet weather or if rain is likely to fall.

7.5.4 Care of Existing Surface

Avoid damage to existing surface on which the mix is placed.

Repair any damage.

7.5.5 Mixing

Mixing plant to be capable of maintaining the mix proportions.

Add cement and water to material to be stabilised and mix for a minimum period of 30 seconds.

Material to be uniform and without segregation.

BATCH MIXER

Scales used for weighing cement for batching plants will be used solely for that purpose.

Proportion the dry materials by mass.

CONTINUOUS MIXER

Proportion the dry materials by volume.

Use a continuous feeder which allows feed rate of different aggregate sizes to be adjusted separately.

7.5.6 Delivery

Minimise segregation during loading and unloading and discharge directly into the hoppers of paving machines without spillage.

Provide open trucks with tarpaulins.

7.5.7 Laying

**PAVING MACHINE**

Deposit and spread the pavement material in one operation using self propelled mechanical tamper-spreaders.

Lay material uniformly without segregation to produce a uniform surface texture and required thickness.

**GRADER LAYING**

To be used on minor work only. Spread the material in one layer not less than 75 mm nor more than 200 mm compacted thickness.

7.5.8 Compaction, Finishing, Construction Joints and Curing

Conform to the requirements specified for in situ stabilisation.

7.6 CONFORMANCE

7.6.1 Tolerances -

For stabilised layers conform to the tolerances specified in the PAVEMENTS AND SHOULDERS section and with the following:

7.7 CONFORMANCE

7.7.1 Tolerances -

For stabilised layers conform to the tolerances specified in the PAVEMENTS AND SHOULDERS section and with the Table – Stabilised Layers Conformance:

7.7.2 Testing – Hold Point

STABILISER APPLICATION RATE

The Contractor shall be responsible for checking the application rate.

Determine the stabiliser application rate in accordance with NTTM 204.7.
Table – Stabilised Layers Conformance

<table>

</table>

[i] apply if a preliminary trial is carried out (i.e. total area over 1000m²)
[ii] apply if a preliminary trial is not carried out (i.e. areas under 1000m²)
Take samples for Liquid Limit, Plastic Limit, Linear Shrinkage, California Bearing Ratio from the unstabilised pavements.

Refer to the Conformance Testing Section for Test Frequencies.
Correct application deficiencies by the application of additional stabiliser and remixing if mixing has already commenced.

**STABILISER CONTENT**

The Superintendent will carry out conformance testing.

**COMPACTION**

The Superintendent will carry out conformance testing.

Check areas for level tolerance and layer thickness before testing.

Only the finished compacted pavement complying with level tolerance and layer thickness will be tested. Dry Density Ratios will be determined 24 hours after final compaction. Backfill test holes within 24 hours of testing with new stabilised material.

**Hold point** - Superintendent to approve conformance of stabilised layer prior to priming.

**7.7.3 Rideability**

Surface roughness testing will be carried out by the Superintendent at the discretion of the Superintendent.
8. SPRAY SEALING

8.1 STANDARDS

Conform to the following Standards and Publications unless specified otherwise:

- AS 1141: Methods for sampling and testing aggregates
  - AS 1141.14: Particle shape, by proportional caliper
  - AS 1141.15: Flakiness index
  - AS 1141.18: Crushed particles in coarse aggregate derived from gravel
  - AS 1141.20.1: Average least dimension – Direct measurement (nominal size 10 mm and greater)
  - AS 1141.20.2: Average least dimension – Direct measurement (nominal sizes 5 mm and 7mm)
  - AS 1141.23: Los Angeles value
  - AS 1141.24: Aggregate soundness – Evaluation by exposure to sodium sulphate solution
  - AS 1141.25.1: Degradation factor – Source rock
  - AS 1141.26: Secondary minerals content in igneous rocks
  - AS 1141.29: Accelerated soundness index by reflux

8.2 DEFINITIONS

Reference should be made to AUSTROADS – AP-C87-10 Glossary of Austroads Terms to give definitions on all aspects of Bituminous Surfacing works where required.

ADHESION AGENT:
A substance used for the purpose of promoting the adhesion between binder and aggregate.

ASTM
American Society For Testing And Materials

COARSE GRAINED AGGREGATE:
Where the average grain size of the constituent minerals is greater than 1mm. The average grain size is determined optically under a petrographic microscope or by calibrated hand lens.

CUTTER (Kerosene):
A light petroleum distillate added to bitumen to temporarily reduce its viscosity.

DEPARTMENT, THE / DoI
Department of Infrastructure.

FINE GRAINED AGGREGATE:
Where the average grain size of the constituent minerals is less than 1mm. The average grain size is determined optically under a petrographic microscope or by calibrated hand lens.

FLUX OIL:
A petroleum distillate added to bitumen produce a long term reduction in its viscosity.

NATA
National Association of Testing Authorities

NTCP  Northern Territory Code of Practice

NTTM NT Test Method

PMB Polymer Modified Binder

PRECOATING MATERIAL:
A material used for pre-coating aggregate to promote adhesion of bitumen. Do not use Diesel.

PRIME:
An application of a Primer to a prepared base without cover aggregate to provide penetration of the surface temporary waterproofing and to obtain a bond between the pavement and the subsequent seal or asphalt. It is a preliminary treatment to a more permanent bituminous surface. No Diesel products.

PRIMERSEAL:
An application of primer binder with a fine cover aggregate to a prepared base to provide penetration of the surface and retain a light cover aggregate.

RESEAL: A seal applied to an existing sealed, asphalt or concrete surface.

SAMIR: Strain Alleviating Membrane Interlayer

SEAL: A sprayed application of bituminous binder into which aggregate is incorporated. May include more than one application of binder and aggregate, and may include geotextile fabric.

8.3 SCOPE

Spray sealing treatments include:
Prime
Primerseal
Enrichments

Initial Seal or Reseal:
- With conventional bitumen, cutback bitumen or bitumen emulsion binder
- With modified binder
- Incorporating geotextile fabric reinforcement.

Spray sealing work consists of:
- Supply and delivery of materials.
- Storage and handling of raw materials.
- Precoating of aggregate.
- Preparation of pavement surfaces.
- Preparation of bituminous materials.
- Recording of spray sealing works.
- Sampling of Bituminous Products.
- Application of primer and/or primerbinder and/or binder.
- Spreading and rolling of aggregate.
- Removal of loose aggregate.
- Traffic Control.
- Installation of temporary pavement markers.
- Installation of after-care signage.
- Traceability of works and materials.

8.4 MATERIAL REQUIREMENTS

8.4.1 Aggregates
Aggregates must be clean, hard, durable, skid resistant, dry crushed stone, or gravel of uniform quality free from noxious weeds and other deleterious material, and conform with the properties specified. Minimum two crushed faces.
Nominate source of aggregate supply. Submit to the Superintendent current NATA endorsed test result certificates providing evidence that the nominated aggregate supply conforms to specified properties. Aggregate used for testing must be sampled from project site.
Conform to the table - AGGREGATE GRADING AND AVERAGE LEAST DIMENSION, and to the table - AGGREGATE PROPERTIES

8.4.2 Table - Aggregate Grading and Average Least Dimension
Refer to Clause 8.21 for Tables

8.4.3 Table - Aggregate Properties
Refer to Clause 8.21 for Tables

8.4.4 Cutter
Cutter is to be Kerosene or Jet A1 Aviation Turbine Fuel – conform to TABLE - CUTTER OIL PROPERTIES.

8.4.5 Table - Cutter Oil Properties
Refer AS 3568 – 1999 Table 1 for complete specification requirements.

8.4.6 Precoat and Adhesion Agents
Adhesion Agents are to be in the concentrated form and not contain Diesel as part of the mixture.
Precoat all aggregates to conform to the following:
Precoat mixture is to be 100/0/100/1 and not contain Diesel as part of the mixture.
Bitumen residue (by mass): 50%.
Kerosene (by Mass) 50%
Adhesion agent (by mass): minimum 1%

8.4.7 Bitumen
Standard Classes of bitumen to conform to the requirements of AS 2008.
 Manufacture all AS 2008 bitumens in a refinery and have NATA endorsed certificates of manufacture.
Durability Value in accordance with AS 2341.13 is to be a minimum of 7 days with no maximum value.
Multigrade bitumen to comply with AGPT/T190.

8.4.8 Cut Back Bitumen
Conform to the requirements of AS 2157 and table - CUT BACK BITUMEN PROPERTIES.
Designation is by AMC class.
8.4.9 Table - Cut Back Bitumen Properties

8.4.10 Bitumen Emulsion
Refer to PROJECT SPECIFIC REQUIREMENTS section in the RFT for details of type of emulsion to be used.
Conform to the requirements of AS 1160.
Utilise within 90 days of manufacture.
Spraying temperature: 60% bitumen content 30 to 60 °C.

8.4.11 Polymer Modified Binder
A mixture of Standard Class bitumen and elastomeric polymer or crumb rubber additive.
All conformance testing to be carried out in accordance with Australian Standard Test Methods.
Base binders for the production of PMB must meet the specification limits outlined in Table-Base Binder for Polymer Modified Bitumen, from the refinery. All base binders must be tested for conformance to ensure compliance before manufacture into PMB’s.
Polymer Modified Binders must conform to the requirements outlined in Table – Polymer Modified Binders for Sprayed Sealing Applications.
Conform to the table - POLYMER MODIFIED BINDERS FOR SPRAYED SEALING APPLICATIONS.

8.4.12 Table – Base Binder for Polymer Modified Bitumen
Refer to Clause 8.21 for Tables

8.4.13 Table – Polymer Modified Binders for Sprayed Sealing Applications
Refer to Clause 8.21 for Tables

8.4.14 Geofabric
Use non-woven, polyester, isotropic, needle punched fabric for geotextile reinforced seals.
Conform to the table – GEOFABRIC PROPERTIES. Supply certificate of compliance with the respective AE Lot data. Include Traceability of Batch Numbers with the respective AE Lot data.

8.4.15 Table – Geofabric Properties

Supply certificate of compliance with the respective AE Lot data. Include Traceability of Batch Numbers with the respective AE Lot data.

8.5 SPRAYERS AND PERSONNEL
Sprayers must have current calibration accredited by a tester nominated on the Australian Asphalt Pavement Association (AAPA) website. All calibrated sprayers must be listed on the AAPA website. A copy of the calibration certificate must be with the vehicle at all times.
Calibrate sprayers yearly.
Ensure sprayer driver and operator are skilled and trained with an understanding of sprayer calibration and an appreciation of the requirements of the work.

Ensure relevant personnel understand the types and quantities of the various materials and mixtures to be used.

Bitumen Spraying plant and equipment must be in good working condition at all times.

**Cycle and Pedestrian shared Paths- Witness Point**

All relevant design principles contained in AUSTROADS must be integrated in the design of cycle ways, pathways and associated infrastructure (Austroad guide to Road Design Part 6A: Pedestrian and Cyclist Paths). Refer to Design drawings (if any) and conform to local Council requirements. Refer to PROJECT SPECIFIC REQUIREMENTS section of Request for Tender.

### 8.6 PREPARATION OF PAVEMENT

Remove raised reflective pavement markers. Repair any damage to the pavement surface caused by the removal of raised reflective markers with an emulsion/sand mixture before sealing.

Sweep the pavement surface to remove loose stones, dust, dirt and foreign matter immediately before spraying.

Maintain the prepared surface.

Extend sweeping clear of the area to be sealed.

Remove adherent patches of foreign material with a steel scraper.

Dampen the prepared surface lightly immediately before spraying (for priming and primersealing only).

Remove water from the surface of primed or sealed pavements before applying binder.

Do not allow traffic on the prepared surface.

### 8.7 SETTING OUT

Mark out by string line or paint.

Include pavement widening.

### 8.8 BINDER COAT REQUIREMENTS

Refer to PROJECT SPECIFIC REQUIREMENTS section in the RFT for spray rates to be used for calculating tender quantities.

#### 8.8.1 General

The Contractor must rectify bleeding or flushing seals during the defined defects period where binder application rates were applied at > than 105% of the designated volume.

#### 8.8.2 Prime, primer seals and enrichment coats

Provide bitumen complying with; Table – Base Binder for Polymer Modified Bitumen

Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT for cut back requirements.

Cut-back bitumen mixed on site:

Heat bitumen to a temperature appropriate for achieving final spraying temperature making allowance for incorporation of the unheated cutter.

Add unheated cutter to heated bitumen and circulate until a homogeneous mixture is achieved.

Spray immediately circulation is complete.

Allow at least three days to elapse after priming before applying the binder coat.

Keep traffic off the primed surface for this period.

#### 8.8.3 Straight Run Binder Coats

Provide bitumen Class 320 complying to AS 2008 as follows:

- Initial seal coat
- Seal coat for geotextile seal or re-seal
- Re-seal coat

Heat to spraying temperature but do not exceed the maximum. Avoid heating bitumen in quantities excess to requirements Prevent foaming.

Ensure product meets the requirements of the specification at point of delivery.

#### 8.8.4 Polymer Modified Binder Coats

Provide bitumen in conformance with Table – Base Binder for Polymer Modified Bitumen blended with the required polymer as follows:

Prepare the product in a manufacturing or blending plant that complies with the Guide to the Manufacture, Storage and Handling of Polymer Modified Binders, Australian Asphalt Pavement Association, 2013.

Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT for:

- Initial seal coat: Class
- Reseal coat: Class

Ensure product meets the requirements of the specification at point of delivery.

Store, mix, heat and spray the polymer modified binder as recommended by the polymer manufacturer.

Both coats of two coat seals shall contain polymer.
8.8.5 Binder Coats, Tender Quantities
Refer to the RFT PROJECT SPECIFIC REQUIREMENTS section for spray rates used as a basis for calculating tender quantities.

8.9 SAMPLING OF Binder – WITNESS POINT

8.9.1 Test Request
Darwin Urban areas – Test requests are to be sent to the panel period contractor to witness sampling and arrange testing.
All other areas - the supplier is to sample and deliver the sample to DoI staff within 48 hours.

8.9.2 Supply of Sampling Containers
Supply all sampling containers as required for sampling purposes.
- Sample containers are to be leak proof and having a capacity of not less than two litres.
- Sample containers must be clean, rust free and capable of receiving a product at high temperatures.

8.9.3 Definition of Sampling
- A sample is three containers of product collected at the same time from the same supply source.
- One sample container is for the Contractor’s analysis.
- Two sample containers are for the Department to analyse.

Note: Refer to the Superintendent for requirements if samples are non-conforming

8.9.4 Frequency of Samples
Refer to CONFORMANCE TESTING section.

8.9.5 Collection of Samples – WITNESS POINT
Take samples prior to addition of adhesion agents.
Conformance test sampling is to be collected at point of delivery.
Ensure bulker has adequate sampling cocks installed so as samples can be taken on transfer from the bulker to the sprayer. Do not take bituminous samples from the spray wagon, except for prime samples.

Witness Point – Take samples from the point of delivery on transfer from the bulker to the sprayer or as directed. Where transfer is for works in the urban area or for small works ensure that conformance testing is ordered and samples are taken at the point of transfer from bulker to sprayer.
All sampling must be in accordance with Australian or Austroads standards. The supplier is to perform the sampling. Ensure staff carrying out sampling are competent in sampling methods.
Ensure sampling techniques do not allow contamination of the samples.
Where samples are not collected, Level 1 (10%) adjustments (Table – Pavement Adjustments, MEASUREMENT AND PAYMENT Section) will apply to the total materials represented.

8.9.6 Sample Identification
Samples must be clearly identified with permanent marker on adhesive labels on each tin.
Mark samples with the following information on the container at the time of collection.
- Container number.
- Sample number.
- Date and time of sample taken.
- Designation or Classification of Materials.
- Sample Temperature.
- Tanker/Sprayer Identification Number.
- Name of Supplier.
- Road Name and number.
- Site Identification.
- Location and Chainage.

8.9.7 Storage and Delivery of Samples
Store all samples taken to prevent accidental damage or contamination. Submit sample containers at the completion of each days spraying.

8.9.8 Stockpile Sites
Stockpiles in urban areas are not permitted.
Urban areas for Darwin region is nominated as – North of Cox Peninsula Road (Stuart Highway), West of Tripe Road (Arnhem Highway) and the end of seal on Gunn Point Road.
Existing stockpile sites – clean to suit.
Provide a separate site for each aggregate size. Allow 15 metres between adjacent sites.
Ensure sites are well drained and on hard ground. Avoid contamination by dust.
For new stockpile sites, construct gravel foundation for stockpiles with 100 mm compacted thickness. Trim and compact to 95% relative compaction in accordance with the PAVEMENTS AND SHOULDERS Section. No new stockpile areas are to be constructed without the prior written approval of the Superintendent.
Maintain access roads and stockpile sites.
Do not allow stockpiled aggregates to become wet due to rain. Cover all stockpiles with sheet plastic or similar material.
Avoid sites under trees, telephone lines, overhead transmission lines or where overhead clearance is less than 6 metres.

Clear all vegetation to 5 m beyond stockpile boundary.

Remove from site any non-conforming aggregate.

For work in or close to regional centres, towns and urban areas (50km), remove all unused aggregate from stockpile sites at conclusion of work.

For rural work, prepare unused aggregate into one neat and tidy stockpile, per aggregate size. Aggregate remaining in stockpiled areas becomes property of the Northern Territory Government at Practical Completion stage.

8.10 PRECOATING AGGREGATE

All aggregates used must be dry before precoating.

No precoat is required for SAMI and Emulsion seals, unless stated in the response schedules.

Apply a uniform film of precoating material to the all aggregate used for sealing purposes.

Aggregate which has been excessively precoated will be rejected.

Precoating is to take place at pre approved site stockpile locations unless otherwise approved by the Superintendent.

All precoating must be performed with a powered shaking screen deck precoater, which removes dust, dirt and oversize materials and evenly applies precoat to the aggregate.

8.11 ADHESION AGENT

Adhesion agent must be used.

Use 1% adhesion agent in the binder. Written Superintendent approval must be obtained for variation of this rate.

Circulate in binder for 20 minutes before spraying.

Provide the Superintendent a copy of the Safety Data Sheet information of the adhesion agent prior to its intended use.

8.12 SPRAYING – WITNESS POINT – HOLD POINT

Witness Point - Give the Superintendent 48 hours notice of intention to spray bitumen.

Store bitumen at lowest practical temperature and for the shortest possible duration.

Comply with Table – Temperature Control Requirements for Polymer Modified Binders

Seek approval to vary these requirements.

Remove bitumen from the site when temperature limits are exceeded.

<table>
<thead>

<tr>
<td>Holding time for medium term storage</td>
<td>30 days</td>
<td>7 to 10 days</td>
</tr>
</tbody>
</table>

8.12.1 Atmospheric Conditions

Commence spraying only when pavement temperature

- is in excess of 20 °C , or
- has been in excess of 15 °C for at least one hour.

For cutback work, commence spraying when pavement temperature is in excess of 10 °C .

For emulsion work, commence spraying when pavement temperature is in excess of 5 °C .

Cease spraying if rain threatens, or in windy or dusty conditions.

Protect the work in the event of a sudden change in weather by closing the affected section of road or by rigidly controlling traffic speed.

8.12.2 Preparing the Sprayer

Circulate the mixture.

Check the horizontal and vertical alignment and the cleanliness of the spraybar and its extensions.

Determine the appropriate number of nozzles for the width to be sprayed. Ensure the end nozzles fitted are EAN18W.

Check that the nozzles in use are symmetrical about the sprayer.

Check the alignment and setting of the nozzle to ensure that the fans of material from intermediate nozzles are parallel and at an angle of 30 deg. to the centre line of the spraybar. Ensure that the fans from the end nozzles are parallel to each other and at an
angle of 45 degrees to the centre line of the spraybar.
Set the height of the spraybar so that the lower faces of the nozzles are 250 mm (or that specified on the calibration certificate) above the pavement when the sprayer is full.
Fit an end shield to the spraybar when necessary to prevent spraying material on the kerb, or to counter any wind effects which would compromise uniform spraying.
Position the guide rod to conform to the setting out and edges of spray. Check by making a dummy run.

8.12.3 Application Spray Rates – Hold Point
Application spray rates shall be determined by the Superintendent, using appropriate Austroads design methods.
For new seals and reseals, supply the following to the Superintendent, 3 working days prior to the planned commencement of sealing, to allow the spray rates to be calculated:
- Particle Size Distribution (1 per 250 tonne - minimum 3 tests)
- Average Least Dimension (ALD) (1 per 250 tonne - minimum 3 tests)
- Flakiness Index (FI) of the aggregate, (1 per 250 tonne - minimum 3 tests)
- Ball Penetration testing (for new seal work)
- Dryback results (for new seal work)
Refer to Conformance Testing for sampling requirements of aggregates.

Hold Point – Do not commence spraying until the spray rates are advised by the Superintendent.
Spray rates to be at 15 °C adjusted in accordance with the table - BITUMEN EQUIVALENT VOLUMES.
For primers, primer seals and polymer modified binders, the rate of application refers to the whole of the mixture, including all modifiers, cutback materials, combining oils and adhesion agents. For enrichments and emulsion seals, the rate of application refers to the whole of the mixture.

8.12.4 Preparation for Sprayer Run – Witness Point
Record the volume and temperature of the sprayer contents while it is on level ground.
Supply Sprayer Tank dips before and after each sprayer run.
Witness Point - Allow visual inspection when requested.
Determine the length of sprayer run from the available quantity in the sprayer and the application rate. Ensure the area to be sprayed is not greater than the area that can be covered by aggregate in the loaded trucks.
Start and finish each spray run on a protective strip of paper placed on the pavement. The paper to be wide enough to ensure the sprayed material is being discharged correctly over the full width of spray. Place sufficient protective paper to protect road fixtures.
Place paper on the pavement and masking around areas to be sprayed or wherever the sprayer is stationary on the road pavement.
Seal joins are only allowed where linemarking is to be placed. No joins are allowed in wheel paths.
Excess overspray and spills must be removed before sealing works proceed.

8.12.5 Installation of Temporary Pavement Markers
Temporary Pavement Markers to conform to AS1906.3.
Spacings of temporary pavement markers to be in accordance with AS 1742.3.

8.12.6 Sprayer Run
Attain uniform spraying speed before spraying commences.
Avoid an excess or deficiency of material due to faulty overlap at longitudinal joints when spraying a road in half-widths.
Overlap to be 300 mm with an intermediate nozzle.
Do not use end nozzles on an overlap.
Make allowances for “Fog Spraying” when joining to existing seals.
Cease spraying before the level of material in the tank falls to a level which reduces the full discharge of the pump.
Remove and dispose of all paper as per the Environmental Management Plan.
Clean off any sprayed material from road fixtures.

8.12.7 Hand Spraying
Plan work to minimise the requirement for the use of a hand sprayer.
Any strips of pavement not adequately covered with sprayed material to be sprayed later with the hand attachment.

8.13 APPLICATION OF GEOFABRIC – HOLD POINT
Hold Point - Submit details of proposed machinery and method of application.
Overlap longitudinal and transverse joints 150 mm minimum.
Place longitudinal joints in the fabric along lane boundaries within 100 mm of lane marker. Trim the fabric as required to achieve this.

Bond the fabric to the pavement with a tack coat sprayed 100 mm wider than the fabric and in accordance with the Superintendent’s directions for location. Use Standard Bitumen class C320 for the tack coat.

Place the fabric under tension when laying, using suitable machinery, ensuring that folds or creases do not occur. Use equipment to place fabric that does not cause undue migration of the underlying tack coat into the fabric.

Upon completion of placing of fabric and prior to application of the second/top binder coat, roll the fabric with a minimum 4 passes of a pneumatic multi-wheel roller. Carry out rolling of the geofabric at a constant roller velocity with no acceleration or deceleration.

Use Standard Class C320 binder for the second/top binder coats.

8.14 APPLICATION OF AGGREGATE – WITNESS POINT

Witness Point - Load aggregate into appropriate aggregate spreading trucks using a loader which does not contaminate the aggregate with dust, dirt and oversize stone.

Apply aggregate to sprayed binder within:
- 10 minutes where the pavement temperature is 20 °C or greater.
- 5 minutes where the pavement temperature is between 15 and 20 °C.

Polymer Modified Binders: Apply aggregate within 5 minutes irrespective of pavement temperature.

Apply aggregate to emulsion coat before the emulsion breaks.

Use “cut off plates” on spreader boxes to ensure that the correct widths are covered in aggregate, without overlap.

In trafficked areas, apply both coats of a two coat seal on the same day. Where not trafficked apply the second coat on the following day.

8.14.1 Aggregate Spread Rates

Spread the aggregate evenly and uniformly over the sprayed surface at a rate complying with TABLE – AGGREGATE SPREAD RATES

Use a mechanical spreader, manual spreader boxes are not to be used.

Rerun or hand cover bare or insufficiently covered areas after the first spreading.

Remove all excess aggregate.

8.14.2 Table – Aggregate Spread Rates

</tbody>
</table>

8.14.3 Rolling Rate

Roll the treated surface with self-propelled rubber tyred rollers with a minimum tyre pressure of 600 kPa and a minimum wheel load of 1 tonne.

Roller speed on the first pass to be between 5 and 10km/h, with subsequent passes between 15 and 25 km/h.

Conform to the following:
- Entire area to receive one roller pass immediately after covering.
- 75% of rolling within 1 hour of covering.
- 100% of rolling within 2 hours of covering.

Minimum Rolling Rate: 1 roller hour per 2,000 litres of binder.

Ensure a uniform distribution of aggregate. Drag broom to distribute surplus aggregate but do not...
dislodge embedded aggregate. Drag broom before 50% of rolling is complete. Drag brooms are not to be rotary brooms.

For two coat treatments, double the specified rolling rate if the second coat is to be applied immediately or the surface is not to be trafficked.

Roll in daylight hours only.

Sweep all loose aggregate from the carriageway at completion of rolling.

Ensure aggregate on the final surface is uniformly distributed and firmly held by the binder.

Adjust drag broom to distribute surplus aggregate, but not to dislodge embedded aggregate. Ensure aggregate on the final surface is uniformly distributed, and firmly held by binder.

Re-roll the surface after sweeping to ensure uniform bedding of aggregate in binder.

8.15 TRAFFIC ON RESEALS

Co-ordinate work to minimise traffic delays.

Prohibit traffic
- until at least 3 passes of a roller has taken place or until sufficient rolling has taken place to prevent damage to the applied seal, whichever is greater; and
- from adjacent strip of roadway during spraying.

8.16 WASTE MATERIAL

In urban areas, remove all excess aggregate by suction broom. Ensure no aggregates are distributed onto the verge.

Remove from the site and dispose of all waste material.

Clean and remove all aggregate from the shoulders and verges in urban areas.

Urban areas aggregate removal / sweeping regime:
Initial sweep after rolling has concluded
Second sweep after 24 hours
Third sweep after 48 hours.

8.17 REPORTING

8.17.1 Spraysheets

Supply to the Superintendent at the end of each days production spraysheets that record the following information for all spray runs conducted.
- Contractors Name
- Project Details
- Contract Number

- Specification schedule number
- Road Name
- Product Type Sprayed
- Precoat type used, Precoat litres / m3
- Aggregate supplier, Aggregate Type, Aggregate size
- Run number, Start Time of spray run
- Pavement Temperature, Ambient Temperature
- Start Chainage of spray run – actual km of road
- End chainage of spray run – actual km of road
- Total Length, Width of spray run
- Total area of spray run
- Temperature of product at spraying
- Start Dip, End Dip
- Total sprayed hot, Correction factor, Total sprayed cold
- Application rate cold
- Ordered application rate
- Percent of application rate ordered
- Number of rollers used
- Bitumen sample number
- Signature of contractor representative
- Signature section for client representative

8.18 CONFORMANCE

8.18.1 Tolerances

Final surfaces shall conform to the following:
Aggregates are to conform to “Table – Aggregate Properties”

Skid Resistance determined by NTTM 304.1.

Skid resistance testing may be carried out by the Superintendent.

Final surfaces with non-conforming skid resistance will be rejected.

Rectify non-conforming work by methods approved by the Superintendent. Rectification work be at the Contractor’s expense, including the cost of testing.

Remove from the site binder which has been overheated or has deteriorated or become contaminated prior to its application to the road.

Spray rates applied at less than 95% or more than 105% of the rate indicated in the procedure will be rectified by resurfacing at the contractors expense inclusive of all materials.
8.19 ADJUSTMENT TO VOLUMES FOR SPRAY RATES

This includes the prime coat, enrichment coat, emulsion coat, primerseal and seal coats. Refer MEASUREMENT AND PAYMENT CLAUSES for schedules of adjustments.

Notes:
1. Class of PMB: S=Sealing, E=Elastomeric Polymer, R=Granulated Crumbed Rubber
2. NA means not applicable for that PMB class, TBR = To be reported
3. AGPT Test Methods are available from Austroads Guide to Pavement Technology Part 4H: Test Methods
4. S35E must be manufactured with Polybutadiene (PBD) polymers (To be used only if approved by the Superintendent, as an alternative to S10E).
9. DENSE GRADED ASPHALT

9.1 CONTRACTORS RESPONSIBILITIES

The Contractor is responsible for the production and placing of the registered and approved design mix in accordance with the technical requirements of this specification.

The Contractor must undertake conformance testing in accordance with Section 5 and maintain a record of test results in accordance with the Contractor’s Quality System.

9.2 STANDARDS

Conform to the following Standards and Publications unless specified otherwise:

- AS 1141 Methods for sampling and testing aggregate.
- AS 1160 Bituminous emulsion for the construction and maintenance of pavements.
- AS 2008 Residual bitumen for pavements.
- AS 2150 Hot mix asphalt – a guide to good practice.
- AS 2157 Cut back bitumen.
- AS 2758.5 Aggregates and rock for engineering purposes - Asphalt aggregates.
- AS 2891 Methods of sampling and testing asphalt.

9.3 DEFINITIONS

COURSE GRAINED AGGREGATE:
Where the average grain size of the constituent minerals is > 1mm. The average grain size is determined optically under a petrographic microscope.

FINE GRAINED AGGREGATE:
Where the average grain size of the constituent minerals is < 1mm. The average grain size is determined optically under a petrographic microscope.

IRI International Roughness Index (IRIqc)

JOB MIX:
Adjusted blend composition of registered mix design based on production trial.

NTCP Northern Territory Code of Practice

NTTM Northern Territory Test Method
RAP Reclaimed Asphalt Pavement

REGISTERED MIX DESIGN:
An asphalt mix which has been placed on the DoI Asphalt Mix Design Register and approved for use by the Superintendent.

WARM MIX ASPHALT:
Warm Mix Asphalt (WMA)” is asphalt that contains a warm mix additive, or utilises a warm mix process, that has the ability to reduce the mixing and compaction temperature requirements below the typical temperatures used for that application.

9.4 TRAFFIC CATEGORIES

Unless specified otherwise, the following traffic categories shall be used to determine the required mix design level and binder type.
9.5 MATERIALS

9.5.1 Coarse Aggregates
Ensure coarse aggregates are clean, hard, high strength, angular, skid resistant, durable crushed stone of uniform quality and free from laminated particles, clay and other aggregations of fine material, soil, organic matter and any other deleterious material. Conform to the Table – Properties – Coarse Aggregates.

9.5.2 Fine Aggregates
Ensure fine aggregates are clean, hard, sharp, washed, durable natural sand and/or material manufactured from crushed stone of uniform quality free from clay and other aggregations of fine material, soil, organic matter and any other deleterious material.

9.5.3 Mineral Filler
A finely divided mineral material, natural or crushed, hydrated lime or cement with a particle size smaller than 0.075 mm.
Use filler that is dry, free from lumps, clay, organic material or any other deleterious material, and complies in all other respects with the requirements of AS 2150.

9.5.4 Bituminous Binder
Bitumen Class 320, conforming to requirements of AS 2008.
Polymer Modified Binders conforming to the requirements of Austroads Framework Specification for Polymer Modified Binders and Multigrade Bitumen, AGPT/T190. Properties of PMB grades referred to in this specification are outlined in the following table:

Table – Polymer Modified Binders For Asphalt Applications

</table>

9.5.5 Bitumen Emulsion
A rapid setting bitumen emulsion, conforming to requirements of AS 1160.

9.5.6 Additive
An additive may be proposed provided that full details of the type of additive are provided and
the design mix standards of the PROPORTIONING OF MIXES Clause are attained. This must be nominated and shown as part of the mix design at the design approval stage.

9.5.6 Reclaimed Asphalt Pavement
Crush and screen reclaimed asphalt pavement (RAP) from milling or excavation of existing asphalt as necessary to achieve a well graded, free flowing and consistent product. Ensure a maximum size no greater than the maximum size of the asphalt being produced.

RAP material must not contain tar binder and be free of contaminants such as unbound granular base material, concrete, clay, soil, organic matter or any other deleterious material.

Place processed RAP material in separate stockpiles prior to use. Where RAP material has been stockpiled for some time and is no longer in a free-flowing condition, reprocess to ensure that it is free flowing at the time of use.

9.6 ASPHALT MIX DESIGN – HOLD POINT

9.6.1 Mix Type and Design Traffic Category
Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT for mix type and design traffic category requirements.

9.6.2 Design Mix Requirements – Hold Point
All asphalt mixes proposed for use on DoI works shall be registered in accordance with DoI Code of Practice for Registration of Asphalt Mix Designs.

Hold Point - No asphalt shall be supplied until the mix has been registered and the Superintendent approves the mix for use. Approval of a registered mix for use under the Contract does not guarantee the handling properties or performance of the mix nor relieve the Contractor from contractual obligations in regards to rectification of defects.

Notify the Superintendent of any proposed changes to the components or proportions of components used in the registered mix.

New mix designs shall be carried out:
(a) where it is proposed to change the source grading or nature of the components or binders; and
(b) when current registered mix designs are more than two years old.

If a registered mix has unsatisfactory handling or field performance, the Contractor or Superintendent may request the mix be de-registered.

9.7 SURFACE PREPARATION – WITNESS POINT

9.7.1 New Construction – Witness Point
Witness Point: Give the Superintendent not less than 24 hours notice of the location and scheduled commencement time of surface preparation works.

Ensure completed surface is constructed to specified density, shape and level.

Base must be tightly bound and free from vegetation and other foreign matter.

Ensure there are no laminations or false pavements and pavement is dried back to the requirements of PAVEMENTS AND SHOULDERS, CONSTRUCTION, Final Pavement Surface prior to application of prime coat.

Broom the surface thoroughly and remove any foreign matter not swept off by the brooming.

Prime the surface as specified in the SPRAY SEALING Section.

Fill depressions greater than 25 mm with a correction course of asphalt.

9.7.2 Resurfacing of Existing Bitumen and Concrete Surfaces
Remove all vegetation, loose and extraneous matter.

Fill depressions greater than 25 mm with a correction course of asphalt.

9.7.3 Cold Planing
Unless otherwise specified or directed by the Superintendent, cold planing shall be carried out in such a manner as to leave a uniform surface parallel with the specified ultimate finished surface of the pavement.

Sweep the planed surface clean of all loose material prior to placing asphalt.

Exposed granular material shall be watered, re-compacted and, where specified, primed or surfaced with a 7 mm emulsion seal prior to pacing asphalt.

Prior to opening to traffic, excavated areas shall be filled with asphalt and compacted flush with the existing pavement in accordance with Clause 9.11.

Where the cold planed surface is to be opened to traffic due to breakdown of supply and placing of asphalt, the surface must be cleaned of all loose material and temporary backfill or ramps provided for safe passage of traffic. Remove all temporary materials prior to placing new asphalt.

For the purposes of the application of the ride quality provisions of this specification, asphalt surfacing following correction of surface shape by cold planing is designated as new work.
Refer PROJECT SPECIFIC REQUIREMENTS section of the RFT for designated areas of cold planing excluded as new work.

**9.7.4  Tack Coat**

Apply a fine spray of bitumen emulsion lightly and evenly over the whole of the area to be covered with asphalt.

The pavement must be dry and dust free before any application of tack coat.

Apply tack coat by spray bar fitted to mechanical sprayer. Hand spray only in areas where it is impractical to use a spray bar.

Protective splash boards or spray skirts must be used to eliminate over spray beyond the surface where tack coat is being applied.

Application rate (Residual Binder): 0.1 – 0.2 litres/square metre unless otherwise directed.

Allow the tack coat to ‘break’ before laying the asphalt.

Clean and tack coat existing surfaces against which new work is to be laid.

Re-apply Tack coat where damaged by construction traffic or weather.

**9.8  MIXING**

Mix in a plant capable of consistently producing asphalt that complies with the approved job mix design.

**9.8.1  Table – Temperatures**

<td>135 *</td>
<td>170</td>
</tr>
</tbody>
</table>

* Minimum of 130 °C when produced as warm mix asphalt

**9.9  TRANSPORT AND SUPPLY**

**9.9.1  Transport**

Ensure that truck trays are clean to permit easy discharge and that transport mix trucks are free from oil leaks.

Cover asphalt during transport to reduce the rate of cooling of the mix.

Fit each truck with an adjustable tailgate to allow control of the mix during discharge into the spreading device.

Ensure delivery dockets provide traceability for each load, including a record of:

- Docket Number
- Time of Departure
- Temperature at manufacture
- Product Type include Bitumen Type
- Mass of Materials – Individual load and Progressive Tonnes

**9.9.2  Rate of Supply**

Deliver the mix at a uniform rate within the capacity of the spreading and compacting plant.

Rate of delivery must allow continuous placing of the mix having regard to:

- the number of haulage vehicles available; and
- the haulage distance to the work.

Minimise cooling of the mix by prompt delivery.

**9.10 SPREADING – WITNESS POINT**

**9.10.1  General**

Lay the final surface layer at a uniform thickness, and as one continuous operation.

Construct a transverse joint whenever the operation ceases.

Remove from site, prior to initial rolling, asphalt that has cooled below the required initial rolling temperature.

Cease laying asphalt during heavy or continuous rain, or in wet conditions where the material will not adhere or key to the surface.

Remove from site all excess or spilt asphalt.

**9.10.2  Mechanical Spreading**

Provide a self-propelled paving machine having an effective capacity of not less than 250 tonnes per eight hour day.

Paving machines must be equipped and operated with automatic joint matching facility.

Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT for information about when other spreaders may be used.

**9.10.3  Hand Spreading**

Hand spread only in locations where mechanical spreading is not possible, and to correct localised depressions or irregularities.

**9.10.4  Laying Pattern – Witness Point**

Complete the work as one continuous operation where practicable.

**Witness Point** - Supply construction program plans 7 working days prior to commencement of works. Confirm paving plan prior to the commencement of each shift.
9.10.5 Trial Areas
Required on projects greater than 1000m² in treated area or where specified in the PROJECT SPECIFIC REQUIREMENTS section of the RFT:
Construct a trial area for each type of mix.
- Dimensions: 3.5 m wide and 30 m long.
- Use the trial to determine the type and number of rollers and the rolling pattern to be used.
- Take compaction cores and continue the trials until compliance requirements are met.
- Maintain the process established by the trial.

9.10.6 Joints Generally
Minimise the number of longitudinal and transverse joints.
Do not leave longitudinal joints on a pavement in use by traffic.
Joints are not to be placed in wheel paths.
Joints are not to be placed at Intersections where practicable.
Offset the joints in multiple layer work by at least 100 mm so that joints in the surface course do not overlay joints in the previous course.
Overlap the finished asphalt by 25 mm to 75 mm when spreading.
Push the overlap asphalt back immediately to form a ridge along the joint.
Roll the ridge to form a smooth level joint.
Remove excess asphalt prior to final rolling.
Prevent the accumulation of coarse particles along the joint by raking.

9.10.7 Traverse Joints
Form transverse joints by cutting the end of the spread material to a vertical face and remove loose material.
Ensure transverse joints are level using a 3 metre straight edge and cut back to the true level surface with no deviation. Minimum of 200 mm or to match cross fall.
Check the surface adjacent to the joint with a straight edge and correct any surface defects immediately.
Treat the face of the joint with bitumen emulsion tack coat prior to spreading adjacent section.
Transverse Match of Overlay to Existing Pavement:
- Saw cut existing asphalt pavement 20 mm depth along the match line of joint.
- Remove taper wedge of existing asphalt pavement along the overlay side of match joint.
- Feather the asphalt overlay down to the existing pavement to achieve a maximum slope of 1 in 10 and for the full width of the pavement.
- Ensure depth of overlay above existing pavement in taper wedge area is not less than 20 mm.

9.10.8 Longitudinal Joints
Keep longitudinal joints straight or follow the line of curvature.
Minimise the unsupported length left overnight.
Rectify broken sections of unsupported edge by cutting a vertical face before resuming laying.
Treat the face of the joint with bitumen emulsion tack coat prior to spreading adjacent section.

9.10.9 Temporary Ramps
Provide ramps of compacted asphalt with a maximum grade of 1% relative to pavement grade, where transverse joints are left overnight on trafficked pavements.
Longitudinal Ramps are to be a minimum of 300 mm when under traffic control.
No temporary longitudinal ramps are to be left unattended.

9.11 COMPACTION
9.11.1 Compaction Generally
Compact by the method established during the construction of the trial area or as approved by the Superintendent.
Compact by using adequate pneumatic tyred and tandem steel wheeled rollers to achieve the specified compaction.
Stand compaction plant clear of the new asphalt surface.
Remove from site plant with fuel or oil leaks.
Defer rolling if excessive displacement of the asphalt occurs but only until the asphalt has cooled sufficiently to permit rolling to continue.

9.11.2 Compaction Temperatures
Compact the asphalt uniformly as soon as the asphalt has cooled sufficiently to support the rollers without undue displacement. Achieve compaction using suitable sized steel wheeled or vibratory rollers or combination of steel wheeled or vibratory rollers and pneumatic tyred rollers. to the standards specified in the COMPACTION and CONFORMANCE clauses.

9.11.3 Initial Rolling
Roll immediately behind the spreader using a steel wheeled roller.
Ensure there is no adverse displacement or cracking during all roller operations.
Provide steel wheeled rollers with adjustable scrapers and keep the drums moist with water.
Prevent the mix from sticking to the drums.
Avoid ponding of water on the pavement surface.
The first breakdown pass of the roller shall be undertaken by a steel drum or vibratory roller with the vibrating function disengaged.

9.11.4 Intermediate Rolling
Roll with a self-propelled pneumatic tyre roller. Ensure tyre pressures are uniform. Ensure that rolling surfaces are smooth.

9.11.5 Intermediate Rolling
Roll with a self-propelled pneumatic tyre roller. Ensure tyre pressures are uniform. Ensure that rolling surfaces are smooth.

9.11.6 Final Rolling
Roll with a steel wheeled roller to remove all roller marks from the surface.

9.11.7 Joint Compaction
Compact all joints and edges. Do not roll unsupported edges with vibratory plant in order to minimize loss of shape and displacement. Roll all joints to obtain a level surface not exceeding 5 mm deviation under 3 m straight edge of the finished pavement surface.

9.11.8 Hand Tamper
Compact by vibratory plates or hand tampers in locations inaccessible to rollers. Side tamp before rolling the edge of all asphalt which is not laterally supported. Finish hand tamped surfaces smoothly and conforming with machine finished areas.

9.12 CONFORMANCE
9.12.1 Conformance Testing
The Contractor is responsible for process control testing. The Superintendent will carry out all conformance testing through the Panel Period Contract. The Contractor is responsible for ordering the conformance tests. Order testing on the “Conformance Test Request” form, giving a minimum of 2 working days notice. Surface roughness testing will be carried out at the discretion of the Superintendent. When lots fail to satisfy the conformance criteria, payment adjustments or rejection of the lot shall be in accordance with the PAYMENT ADJUSTMENTS clause in the MEASUREMENT AND PAYMENT section.

9.12.2 Process Testing
Upon request supply the Superintendent with test reports for all process testing performed on the works.

9.12.3 Finished Pavement Properties

<table>
<thead>
<tr>

Surface Shape: For Surface Shape requirements, refer to Table – Surface Shape Requirements. Refer to Clause 9.12 for Tables

9.12.4 Conformance on Asphalt Production
Conform to following variation limits to the approved Job Mix Design:

<table>
<thead>
<tr>
<th>Table - Variation Limits To The Approved Job Mix Design</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grading:</td>
</tr>
<tr>
<td>AS SIEVE (mm)</td>

</tr>
<tr>
<td>Maximum Density:</td>
</tr>
</tbody>
</table>

Conformance Sampling and Testing Frequencies:
The Superintendent will undertake conformance sampling with samples taken from trucks at the mixing plant. Refer CONFORMANCE TESTING section for frequencies of testing.

9.12.5 Conformance of Compaction
Base the conformance of compaction on lots, determined from cores. Subdivide all items of work into lots, and provide such information to Superintendent. Give each lot a lot number. Number the lots using a logical system. Maintain a register of all lots and lot numbers. Include the location of the lot on the lot register. Select lots of work based upon the following criteria;
- A lot will represent no more than one shift’s production.
- A lot will be continuous and have been brought to completion at the same time.

STANDARD SPECIFICATION – ROADWORKS
DoI REFERENCE TEXT – Oct 2014
Page 67
A lot will be composed of homogeneous material with no distinct changes in attribute values.

Each lot will be subject to conformance testing. Lots will be checked for level tolerance. Quality of the lot will be judged as conformance or non-conformance of each lot including all tests conducted on the lot.

When lots fail to satisfy the conformance criteria, payment adjustments or rejection of the lot will be in accordance with the PAYMENT ADJUSTMENTS clause in the MEASUREMENT AND PAYMENT section.

Should the lot under consideration be subdivided then class each subdivision as a lot and subject each subdivided lot to lot testing.

Treat non-conforming lots, which are subdivided after testing as separate lots and retest each and every subdivided lot.

Core sample locations will be selected by the laboratory on a stratified random basis in accordance with NTCP 103.1. Supply copies of the completed stratified random selection with each compaction report.

Carry out density testing as soon as practicable after completion of works. The work represented by a lot will be assessed as the characteristic value of insitu air voids where the Characteristic Value of Air Voids is calculated in accordance with the CONFORMANCE TESTING section.

The CONFORMANCE OF COMPACTION clause only applies for specified minimum 30 mm asphalt thickness.

10 SLURRY SURFACING

10.1 GENERAL
This section specifies the materials, equipment and procedures for slurry surfacing of existing sealed surfaces.

10.2 STANDARDS
Conform to the following Standards and publications unless specified otherwise.

AS 1160 Bituminous emulsions for the construction and maintenance of pavements.

AS 1289.3.3.1 Methods for testing soils for engineering purposes – Calculation of the plasticity index of a soil.

AS 1289.3.7.1 Methods for testing soil for engineering purposes – Determination of the sand equivalent of a soil using a power operated shaker.

AUSTROADS AGPT/T272 Determination of Abrasion Loss of Bitumen Slurry (Wet track abrasion test)

INTERNATIONAL SLURRY SURFACING ASSOCIATION (ISSA) TB 114 Test method for wet stripping of cured slurry surfacing mixtures.

10.3 COMMENCEMENT OF WORK – WITNESS POINT
Witness point - Give the Superintendent at least 7 days notice of the actual date and time of the commencement of work.

10.4 TRAFFIC CONTROL
Refer to the PROVISIONS FOR TRAFFIC section of this specification.

Take all necessary steps to ensure:
- The safety of traffic during the progress of the work until completion of the final operation or curing, whichever is the latter.
- That traffic does not damage the work on newly treated sections of pavement.

10.5 MATERIALS

10.5.1 Binder – Hold Point
Use bitumen emulsion binder complying with AS 1160.

Hold point - Additives to improve the workability of the mix, or to accelerate or retard setting of the mix may be used with the approval of the Superintendent.

10.5.2 Aggregates
Use mineral aggregate consisting of crushed stone, clean, sharp, angular sand and mineral filler combined to meet the grading as specified in the MIX REQUIREMENTS clause and as set out in the STANDARD MIXES clause.

Use clean aggregate free from vegetable matter, oversize stone and other deleterious substances.

Use combined aggregate and mineral filler having a sand equivalent value of not less than 45 when tested in accordance with AS 1289.3.7.1. and a plasticity index less than 5 when tested in accordance with AS 1289.3.3.1.

10.5.3 Water
Use only potable water and free from harmful soluble impurities.

10.5.4 Mineral Filler
Use an approved mineral product having a minimum of 85% passing a 0.075 mm sieve, thoroughly dry and free from lumps, organic matter and clay particles.

10.5.5 Samples
Supply at any time when requested, sufficient quantities of sample material used or to be used in the work.

Allow the Superintendent to take such samples at any time and provide facilities and any assistance required for this purpose.

10.5.6 Stockpiles
Provide a separate site for each aggregate size and allow 15 metres between adjacent sites.

Ensure sites are well drained and on hard ground. Avoid contamination by dust.

Maintain access roads and stockpile sites.

Avoid sites under trees, telephone lines, overhead transmission lines or where overhead clearance is less than 6 metres.

Clear all vegetation to 5 m beyond stockpile boundary.

Construct gravel foundation for stockpiles with 100 mm compacted thickness. Trim and compact to 95% relative compaction in accordance with the PAVEMENTS AND SHOULDERS section.

Construct stockpiles at least 1 metre high and batter sides 1 vertical to 1.5 horizontal and trim neatly to facilitate measurement.

Remove from site any non-conforming aggregate.

10.6 PLANT & EQUIPMENT

10.6.1 Mixing Machine
Use a self propelled slurry mixing machine with a continuous flow pugmill able to accurately
proportion and deliver mineral aggregate, filler, bitumen emulsion water and additive to the mixing chamber and discharge the thoroughly mixed product on a continuous basis.

**DIP STICKS;**
Use a dipstick on the emulsion and water tanks calibrated to in intervals of 50 litres and on the additive tank use a dipstick calibrated in intervals of 10 litres.

**FINES FEEDER;**
Equip the mixing machine with a suitable fines feeder which provides an accurate metering device to introduce a predetermined amount of mineral filler into the mixer at the same time and in the same location as the mineral aggregate. Provide calibrated controls capable of accurately proportioning the materials.

**WATER PRESSURE SYSTEM;**
Equip the mixing machine with a water pressure system and a fog type spray bar capable of completely fogging the road surface preceding the spreading equipment to a maximum application of 0.3 litres per square metre.

**MACHINE STORAGE;**
For truck or semi-trailer mounted slurry surfacing machines provide sufficient machine storage capacity to allow the adequate mixing and application of a minimum of 7 cubic metres of slurry mixture. This provision does not apply to continuous run slurry surfacing machines.

**GUIDE ARM;**
Fit the machine with a guide arm and chain to assist the driver in following the correct line. Mount the guide arm on the driver’s side of the vehicle, forward of, and in full view of the driver.

**10.6.2 Spreading Equipment**
Attach to the mixing machine a mechanical spreader box distributor, equipped with flexible material in contact with the pavement surface to prevent loss of the slurry surfacing mix from the spreader and capable of distributing the slurry surfacing mix across the width of the box without segregation or overflow while assuring by its design and adjustments that the required width and depth of spread are maintained on varying grades, crowns and superelevations.

**SPREADER BOX;**
Use a spreader box with an adjustable width, capable of spreading up to 4.0 metres in width and equipped with skis or other levelling device to enable it to fill traverse depressions up to 1.5 metres across.

**STEERING;**
Use a spreader box with an adjustable steering device and a flexible strike-off.

**10.6.3 Ancillary Plant**
Provide all ancillary plant such as rotary road brooms, signs, lamps, barricades, hand squeegees, shovels, hand brooms and any other equipment necessary for the performance of the work.

**10.7 MIX REQUIREMENTS**

**10.7.1 General**
Blend the bitumen emulsion with the mineral aggregate and filler in the proportions, by dry mass of aggregate, including filler, to give the required bitumen content of the slurry surfacing mix as specified in the STANDARD MIXES TABLE.

Add sufficient water to provide a mix of workable consistency and this may be varied slightly to suit the surface texture of the pavement and the pavement temperature.

Standard Mixes Table.

</tr>
<tr>
<td>0.30</td>
</tr>
<tr>
<td>0.15</td>
</tr>
<tr>
<td>0.075</td>
</tr>
<tr>
<td>Residual binder content as % mass of aggregate</td>
</tr>
</tbody>
</table>

**10.7.2 Sample Mixes – Hold Point**
Make trial batches to determine the final blend of water, additive and cement to be used for the best results.

**Hold point** - At least 14 days before commencing work, forward the details of the mix design, carried out in a NATA registered
laboratory and performed by a NATA accredited technician, to the Superintendent for endorsement. Once the mix design is endorsed by the Superintendent it becomes the specified job mix.

**10.7.3 Departures from the Job Mix – Table**

The following table provides the maximum mean departures from the job mix for any day’s work.

| Table - Maximum Mean Departures From The Job Mix |
|-----------------------------|------------------|
| **Sieve Size In mm** | **% By Mass** |
| Aggregate | 6.7 | 7 |
| | 4.75 | 7 |
| | 2.36 | 5 |
| | 1.18 | 5 |
| | 0.60 | 4 |
| | 0.30 | 4 |
| | 0.15 | 3 |
| | 0.075 | 2 |
| Bitumen Content | + 1.0 - 0.5 |

If the mix gradings and binder content depart from the job mix by more than any of the maxima shown in the table, halt production until the mix is corrected.

**10.8 PREPARATION AND SET OUT**

**10.8.1 Sweeping Pavement – Hold Point**

Immediately prior to any application of slurry surfacing mix, sweep the pavement as necessary to ensure that the surface is free of loose material, stones, dirt, dust and foreign matter by the use of a mechanically operated rotary road broom, unless otherwise authorised by the Superintendent. Carry out additional sweeping necessary to obtain a satisfactory clean surface by hand using stiff brass or similar brooms.

**PREVIOUSLY SEALED AREAS;**

Prior to the application of slurry surfacing mix adjoining previously sealed areas, sweep the edges of the previously sealed areas to remove loose material for at least 150 mm from the edge.

**FOREIGN MATERIAL;**

Remove adherent patches of foreign material from the surface of the road by steel scraper or other suitable methods. Do not remove any large deposits of foreign material that cannot be removed by reasonable use of the mechanical broom, steel scrapers or other suitable methods. Report the existence of any such deposits to the Superintendent prior to the commencement of spreading.

**Hold point -** Do not commence spreading of the slurry surfacing mix until the prepared pavement has been endorsed by the Superintendent.

**SET OUT;**

Unless following a satisfactory edge line or centre line place pavement marks on the surface at intervals of not more than 8 metres for the slurry surfacing machine to follow, while mixing and spreading.

**10.9 APPLICATION**

Deposit the slurry surfacing mix at the optimum consistency into the spreading box and add nothing more to it. Ensure that the mixing time is sufficient to produce a complete and uniform coating of the aggregate and direct the mixture into the moving spreader box at a sufficient rate to maintain an ample supply across the full width of the strike-off squeegee at all times.

**SLURRY BUILD UP;** If required, squirt minor amounts of water into the corners of the spreader box to overcome temporary build up of slurry surfacing mixture. This has no detrimental effect on the performance of the slurry.

**END OF RUN;**

Square off the end of each run at the point where feathering commenced (ie. that point where there is insufficient material in the spreader box to maintain the full width of spread). Alternatively, the successive run may be lapped, but by no more than 100mm, if it can be demonstrated that no loss of riding surface or fattiness will result.

**INACCESSIBLE AREAS;**

Use suitable hand squeegees to spread the mix in areas inaccessible to the machine.

**JOINTS;**

Make longitudinal joints coincide with lane or centreline markings. Provide suitable width spreading equipment to produce a minimum number of longitudinal joints throughout the work. Half passes and odd width passes may be used where necessary for shape correction but must not be used as the last pass of any paved area. Do not allow excessive build up or unsightly appearance on longitudinal or traverse joints.

**KERBS AND SHOULDERS;**

Take care to ensure straight lines along kerbs and shoulders and do not allow run off on those areas.
TEMPERATURE;
If the pavement temperature exceeds 40 degrees C., immediately prior to the application of the slurry surfacing mix thoroughly wet the surface of the pavement and all crack faces with water. Ensure that all surfaces are uniformly damp and no free water is present on the surface or in the cracks when the slurry surfacing mix is applied.

DAMAGED WORK;
Replace slurry surfacing damaged by unexpected rain after spreading.

10.10 TESTING
MATERIALS TESTING;
Sampling of the mixed material will be requested randomly by the Superintendent during each day's production.
The sample material will be tested by the Principal's NATA accredited testing laboratory contractor using accredited NATA technicians and test results will be provided to the Contractor.

EXCESS AGGREGATE LOSS;
Should the Superintendent identify excess aggregate loss from the surface after the slurry has fully cured, and the mix proportions are within the specified limits, suspend work until tests are taken and the problems rectified.
- Wet stripping test; ISSA TB 114 (minimum 90% coating) to assess the system's coating compatibility with the aggregate source.
- Wet track abrasion test; by AGPT/T272, SST 04 (maximum 800g/m2 loss). If the wet track abrasion re-test value exceeds 800g/m2, halt production until the mix design is corrected and endorsed by the Superintendent.

10.11 SURPLUS, WASTE AND DEFECTIVE MATERIALS
Remove from the work prior to its application to the road any bitumen emulsion which has deteriorated or become contaminated in any way. Bear the cost of replacing any such emulsion for use in the works.

SURPLUS MATERIALS;
Remove surplus materials in stockpiles and elsewhere from the job at the completion of the work.

WASTE;
Dispose of waste aggregate, bitumen emulsion, empty containers or other materials remaining after completion of the work in an acceptable manner and leave the work site in a neat and tidy condition.

10.12 MAINTENANCE
Maintain the completed work in a satisfactory condition for a period of one month after completion of the whole of the work. Maintenance is limited to work which results from failures attributable to the operations of the Contractor.

10.13 RECORDS – WITNESS POINT
Record the particulars of the slurry surfacing work, as required by the Superintendent, on the Department's standard “Daily Record Sheet – Spray Surfacing”. Record the details of aggregate, added filler, emulsion and additive used together with the length and width of run immediately each run is completed.

Witness point - Forward the original copy of the slurry surfacing Daily Record Sheet to the Superintendent daily.
11 MISCELLANEOUS CONCRETE WORKS

11.1 STANDARDS
Conform to the following Standards and Publication unless specified otherwise:
- AS 1012 Methods of testing concrete
- AS 1141 Methods for sampling and testing aggregates
- AS 1289 Methods of testing soils for engineering purposes
- AS 1379 The specification and manufacture of concrete
- AS 1478 Chemical admixtures for concrete
- AS 2349 Method of sampling portland and blended cements
- AS 2350 Methods of testing portland and blended cements
- AS 2758.1 Aggregates and rock for engineering purposes - Concrete aggregates
- AS 2876 Concrete kerbs and channels (gutters) - Manually or machine placed
- AS 3600 Concrete structures
- AS 3610 Formwork for concrete
- AS 3972 Portland and blended cements
- AS/NZS 4671 Steel reinforcing materials
- NTMTM NT Materials Testing Manual
- NTTM NT Test Methods

11.2 GENERAL
This section specifies miscellaneous minor concrete works and does not apply to buildings or bridges.
Note that this Section is for incidental Concrete Works as defined in GENERAL. It should not be used for concrete pavements. Concrete pavements require a specific "one off" specification developed as required.

11.3 MATERIALS
Provide manufacturer's test certificates for quality of cement, aggregate and reinforcement.

11.3.1 Cement
Type GP or GB to AS 3972.
Store cement in watertight containers or shelters until used.
Do not mix or store special cement with normal Portland cement.

11.3.2 Fine Aggregate
Clean, hard, tough, durable, uncoated grains, homogeneous in quality, free from clay, dirt and organic material.

11.3.3 Coarse Aggregate
Clean, hard, durable, crushed stone or gravel, free from clay, dirt and organic material.

11.3.4 Water
Clean and free from oil, alkali, organic or other deleterious substances.

11.3.5 Chemical Admixtures
Do not use admixtures without obtaining prior written approval from the Superintendent.
Admixtures and their use must conform to AS 1478.
Where two or more chemical admixtures are proposed for incorporation into a concrete mix, their compatibility must be certified by the manufacturers.
Store admixtures in accordance with the manufacturer's recommendations.

11.3.6 Reinforcement – Witness Point
Standard: To AS/NZS 4671
Supply, cut, bend and fix steel reinforcement as specified.
Secure reinforcement and bar supports to prevent displacement during construction and concrete placement.
Witness point - Do not place concrete until the reinforcement has been inspected by the Superintendent.

11.3.7 Recycled Crushed Glass (RCG)
Clean, hard, durable RCG free from clay, dirt and organic material. Source the material from glass food and beverage containers, drinking glasses, and window (or flat) glass and plain ceramic. Do not use glass from hazardous waste containers, reinforced and laminated glass, light bulbs, fluorescent tubes and cathode ray tubes. The source glass must be free of debris and contaminants such as paper and cardboard, plastic, fabrics, residues from original contents and toxins.
11.4 CONCRETE

11.4.1 Ready-mix Concrete

Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT for special requirements.

Supply concrete with the following properties unless specified otherwise:

- Compressive strength: N25
- Aggregate size: 20 mm.
- Slump: 80 mm, + or - 15 mm.

Conduct slump testing on site for each and every truck.

11.4.2 Job-mixed Concrete

Use Project Assessment in accordance with AS 3600.

The Contractor will be responsible for sampling and testing.

Provide Project Assessment reports that encompass the period of concrete works.

Not required where insignificant structures and volumes and/or remote locations are involved.

Provide concrete with properties as specified for ready-mix concrete.

Determine the quantities of materials to be used by mass or by equivalent dry loose volume.

Provide and maintain gauges for measurement of the materials.

11.4.3 Addition of Admixtures

Refer to Clause - Chemical Admixtures

Chemical admixtures may only be added subsequent to slump test compliance confirmation. A further slump test post admixture addition may also be required.

Where Superintendent approval has been granted for the addition of superplasticisers at the plant prior to dispatch of concrete, a slump test of each batch must be performed and recorded by a NATA accredited testing laboratory prior to the addition of the superplasticiser. The slump test report shall record the time of the addition of the superplasticiser, amount of superplasticiser added and product identification.

Do not add chemical admixtures unless the exact amount required is measured using a regularly maintained and calibrated device of the required accuracy.

Make allowance for the reversion time of superplasticisers. Delay the addition of superplasticisers as long as practicable before the concrete is discharged from the mixer.

Agitate concrete for at least 5 minutes following the addition of superplasticiser before dispensing.

11.5 FOUNDATIONS

Provide a foundation compacted to 90% relative density within 150 mm of the base of concrete.

11.6 CONSTRUCTION

11.6.1 Kerbs and Gutters

Construct kerbs and gutters as integral units.

11.6.2 Formwork – Witness Point

Design and construct forms so that they are mortar tight and can be removed without damaging the concrete.

Build forms true to line and braced in a substantial and non-yielding manner.

Witness point - Do not place concrete until the formwork has been inspected by the Superintendent.

11.6.3 Placing of Concrete – Witness Point – Hold Point

Witness point - Give the Superintendent sufficient notice so that inspection may be made before and during pouring concrete.

Hold point - Provide verification that all constituent materials, formwork, falsework, reinforcement, and environmental conditions comply with all requirements. Do not cast any concrete without that verification.

Do not place concrete if the temperature of the concrete exceeds 35 °C, or if the ambient air temperature exceeds 40 °C.

Place and compact concrete within the following time after the addition of the mixing water to the mix:

<table>
<thead>
<tr>
<th>Concrete Temperature At Time Of Placing</th>
<th>Maximum Time (minutes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>25 °C to 28 °C</td>
<td>75</td>
</tr>
<tr>
<td>28 °C to 32 °C</td>
<td>60</td>
</tr>
<tr>
<td>32 °C to 35 °C</td>
<td>45</td>
</tr>
</tbody>
</table>

Agitate concrete for at least 5 minutes following the addition of superplasticiser before dispensing.

succeeding concrete is placed against it.

Do not allow concrete to free-fall from a height greater than 1.5 metres.
Place all concrete in dry weather unless otherwise approved.

For each truck of premixed concrete provide an identification certificate on delivery listing the information required by AS 1379 and any other particular requirements for special class concrete.

11.6.4 Jointing

CONSTRUCTION JOINTS
Roughen and clean face of hardened concrete before placing fresh concrete against it. Remove soft material, foreign matter and laitance. Thoroughly moisten the joint surface.

EXPANSION/CONTRACTION JOINTS
Joints to be 10 mm wide over full length and filled with a bitumen impregnated fibrous filler.

Provide vertical transverse expansion / contraction joints as follows:
- Footpaths: 6 m spacing maximum.
- At junctions with other concrete structures Inverts: 15 m spacing maximum.
- All other works: As shown on the drawings.

TOOLED JOINTS
Provide tooled joints as follows:
- Transverse vertical grooves 20 mm depth minimum.
- Joints at right angles to outer edge of concrete works.
- Footpaths: 2 m spacing maximum.
- Kerbs/Inverts: 3 m spacing maximum.
- All other works: As shown on the drawings.

11.6.5 Surface Finishes
Finish surfaces to a smooth and even colour. Remove free surface water during final screeding of unformed surfaces. Round off exposed edges and corners. Protect exposed surfaces from rain until final set has occurred. Smooth tumbled RCG used as an exposed aggregate surface finish. Conform to the table CONCRETE FINISHES.

11.6.6 Curing
Protect and cure all exposed surfaces immediately after the concrete has taken its initial set.

Maintain all surfaces, including those within loosened formwork, in a moist condition by:
- flooding;
- continuous spraying with water; or
- other methods approved by the Superintendent.

Prevent staining during the curing process of all concrete surfaces that will be visible in the completed works. Continuously maintain the protection and curing of each element for the minimum time specified by AS 3600 to provide the concrete with durability corresponding to the specified exposure classification. Do not use curing compounds in lieu of moist curing unless approved.

11.6.7 Backfilling
Backfill areas around the concrete with Select Fill or as otherwise specified. Refer to EARTHWORKS section. Compact the backfilling in layers not exceeding 150 mm compacted thickness. Reinstall damaged grassed areas with topsoil and grass seed.

11.7 RAIN DAMAGE
Remove and replace rain damaged concrete.

11.8 EXISTING SERVICES – HOLD POINT
Hold point - Obtain the Superintendent's approval before altering the line or level of existing services. Place an expansion joint between concrete works and service.

11.9 CONFORMANCE
Refer to the DRAINAGE WORKS Section for culvert structures and pits. Conform to the following:
- Finished level: + or -15 mm from the specified level.
- Invert level: + or -5 mm from the specified level.
- Straight edge deviation of surface: 3 mm max. in 3 m - 6 mm max. in 15 m.
- Alignment: + or -10 mm from the specified alignment.
- Chainage at vehicle crossing: + or -150 mm.
- Width of vehicle crossing: + or -25 mm.

11.10 DEFECTIVE CONCRETE AND MATERIALS
Concrete which is not placed, cured or finished as specified, does not have the specified strength or other specified properties, is not sound, dense, durable or crack-free will be considered defective.

Bear all cost and delays resulting from the rejection of concrete and subsequent rectification. Remove the concrete to a point agreed with the Superintendent at which a visually and
structurally acceptable construction joint can be made, and the defective element rebuilt.

Repair defective surface finishes if approved by the Superintendent. Approval will not be given if the defective area is too extensive or the techniques proposed are not adequate to ensure a visually acceptable and durable repair.

Table – Concrete Finishes

12 DRAINAGE WORKS

12.1 STANDARDS

Conform to the following Standards and Publications unless specified otherwise:

AS 1012 Methods of testing concrete.
AS 1141 Methods for sampling and testing aggregates.
AS 1289 Methods of testing soil for engineering purposes.
AS 1379 Specification and supply of concrete.
AS 1478 Chemical admixtures for concrete.
AS 1597 Precast reinforced concrete box culverts.
AS 1761 Helical lock seam corrugated steel pipes.
AS 1762 Helical lock seam corrugated steel pipes - Design and installation.
AS/NZS 2041 Buried corrugated metal structures.
AS 2349 Method of sampling portland and blended cements.
AS 2350 Methods of testing portland and blended cements.
AS 2439 Perforated plastics drainage and effluent pipe and fittings.
AS 2758.1 Aggregates and rock for engineering purposes - Concrete aggregates.
AS 3600 Concrete structures.
AS 3610 Formwork for concrete.
AS 3706 Geotextiles - Methods of test.
AS 3725 Loads on buried concrete pipes.
AS 3972 Portland and blended cements.
AS 4058 Precast concrete pipes (pressure and non-pressure).

AS 5100.5 Bridge Design - Concrete
NTTMT NT Test Methods
AUSTROADS Guide to Bridge Technology.
ARRB Specifications for Recycled Crushed Glass as an Engineering Material

12.2 DEFINITIONS

CULVERT:
An underground pipe, box or arch constructed in an embankment or trench.

CULVERT SKEW ANGLE:
The angle between a line drawn perpendicular or radial to the road centre line and the centre line of the culvert.

CULVERT CHAINAGE:
The chainage measured along the road centre line at its intersection with the culvert centre line.

LARGE BOX CULVERTS:
Precast box culverts and link slabs having spans greater than 1200 mm, heights greater than 900 mm or fill heights exceeding 1600 mm.

RECYCLED CRUSHED GLASS (RCG):

12.3 GENERAL

This section applies to the construction of precast concrete pipe culverts not exceeding 1950 mm nominal diameter, precast concrete box culverts and other drainage items.

12.4 CLEARING

Clear the site as specified in the CLEARING, GRUBBING AND REHABILITATION Section.

12.5 MATERIALS

Conformance testing will be the responsibility of the Contractor.

Ensure that all pipes and box culverts are indelibly marked with a Standards Australia conformance stamp.

Pipes and box culverts not stamped shall be removed from site at the Contractor’s expense.

12.5.1 Precast Reinforced Concrete Pipes

Pipes to be flush joint type with external rubber bands.

Pipes to be clearly marked as to their class.

12.5.2 Precast Reinforced Concrete Box Culverts – Hold Point – Witness Point

Use box culverts of the inverted U type suitable for installation on a cast-in-situ concrete slab.

Design and supply box culverts which have a span not greater than 1200 mm, height not more than 900 mm and a fill height not more than 1600 mm in accordance with AS 1597.1.

Design all other box culverts in accordance with AS 1597.2.
Use Standard Vehicle Loadings including NT Standard Road Train, with addition of the HLP 400 Abnormal Vehicle Loading on all National Highways, and HLP 320 on all other routes.

Provide culverts designed the exposure classification of the site of the works, determined from AS 5100.5 Exposure Classifications Table.

**Hold point** - Provide drawings showing complete reinforcement and dimensions with tolerances and obtain the Superintendent’s approval prior to fabricating any units. Provide manufacturer’s certification that the provided culverts comply with the applicable sections of AS 5100.5 and with AS 1597. Certify that the design is reflected accurately by the shop drawings and that the design is adequate to resist all specified loads and the soil loads pertaining to the site.

Provide a table of construction axle loads versus minimum required cover for each box culvert size.

**Witness point** - Give the Superintendent notice prior to casting concrete.

### 12.5.3 Corrugated Steel Pipes, Pipe Arches and Arches

Supply in accordance with the details specified. Assemble in accordance with the manufacturer’s instructions.

### 12.5.4 Bedding

Bedding material to be one of the following:
- A clean granular material free from sticks, stones and other deleterious material with a Plasticity Index less than 6, conforming to the table MATERIAL SIZE, or
- RCG conforming to Specifications for Recycled Crushed Glass as an Engineering Material Section 9, or
- Mix blend of RCG conforming to Specifications for Recycled Crushed Glass as an Engineering Material Section 9, and clean granular material free from sticks, stones and other deleterious material with a Plasticity Index less than 6, conforming to the table MATERIAL SIZE.

### 12.5.5 Concrete

Conform to the requirements of the MISCELLANEOUS CONCRETE WORKS Section.

### 12.5.6 Mortar

Use one part fresh cement and three parts clean sharp sand mixed with potable water to yield a stiff but workable mixture.

#### Table – Material Size

<td>0 – 10</td>
</tr>
</tbody>
</table>

### 12.5.7 Select Fill

Conform to the requirements of the EARTHWORKS Section.

### 12.6 CONSTRUCTION OF CULVERTS AND STRUCTURES – HOLD POINT – WITNESS POINT

#### 12.6.1 Setting Out – Hold Point

Measure culvert length along the invert to the outside face of headwalls.

Measure pits and/or manholes to the inside face of the wall.

Finished surface levels for kerbside structures are measured at the top of the kerb.

Set out the culvert and/or structure with pegs before construction.

**Hold Point** - Obtain the Superintendent’s approval for the setting out before construction.

#### 12.6.2 Excavation – Witness point

Excavate in whatever material encountered.

Use of explosives shall be in accordance with the MISCELLANEOUS PROVISIONS Section.

Pump, bail, sheet, shore and brace as necessary.

Divert water when necessary.

Rectify foundations which are affected by rain or surface water entering the excavation.

The total width of trench at and below the level of the top of the pipe shall be the width of culvert plus 300 mm minimum clearance each side.

Backfill with select fill up to the specified level if the trench is excavated too deep. Any such backfilling shall be at the Contractor’s expense.

**Witness point** - Excavate unsuitable material below specified level if directed by the Superintendent.

Replace with select fill, compacted as specified.
12.6.3 Culverts in Fill under Construction

Construct fill to 300 mm above the top of culvert, or to subgrade surface if less, prior to construction of culvert. Re-excavate the fill in accordance with the EXCAVATION clause to permit the construction of the culvert.

12.6.4 Construction Loading on Culverts

Provide the minimum compacted thickness of cover specified in the table MINIMUM REQUIRED COVER THICKNESS before allowing traffic to cross a culvert.

Do not permit construction vehicles having axle loads greater than 10 tonnes to cross large box culverts under any depth of fill unless specific certification is provided by the culvert crown unit manufacturer that the culverts have been designed to cope with those loads.

12.6.5 Table - Minimum Required Cover Thickness (Metres)

Refer to Clause 12.13 For Tables

12.6.6 Bedding

Place bedding 75 mm compacted thickness for the full width of the trench or 0.6 m greater than the width of the culvert for non-trench conditions.

Compact bedding to 90% relative compaction.

Shape the bedding to hold pipes in position during compaction of additional fill.

Place and compact a further (haunching) layer of bedding of 150 mm compacted thickness over the full width of the previous layer after the pipe is in position.

[Consider increasing thickness of haunching for large pipe culverts under high fills, to upgrade maximum bedding factor given in Table 5 of AS 3725]

12.6.7 Laying Generally

Lay culverts commencing from the downstream end.

End caps, when used, shall provide a tight waterproof seal.

12.6.8 Laying Pipe Culverts

Face rebates or sockets upstream.

Rest the full length of the pipe barrel on the bedding.

Position ‘TOP’ marking on pipes to within 5 degrees of the vertical axis.

Fill all joints with stiff mortar firmly rammed into openings. Remove excess mortar from barrel of culvert. Apply external rubber bands.

Brace pipes of 1200 mm diameter and greater with toms until the completion of the embankment and pavement. The toms shall bear against a sill along the invert and a cap against the crown of the pipe. Provide toms opposite every pipe joint.

Cast collars and blocks in one operation. Restrain the culvert prior to constructing the collars or blocks by partially backfilling with bedding around the barrel of the culvert to one-half of the pipe diameter.

12.6.9 Laying Box Culverts

Lay precast box culverts on a cast-in-situ reinforced concrete base slab.

Ensure concrete base slab exceeds external width of box culverts as shown on the typical details.

Butt box culverts firmly together.

Cut away lifting hooks and seal over the affected area with an approved epoxy resin.

Fill all joints with a stiff mortar firmly rammed into the openings. Remove excess mortar from the barrel of the culvert and apply external joint seals, Densopol HT60 or equivalent, 150 mm wide.

12.6.10 Connection to Existing Systems

Repair all cut openings and make watertight.

Demolish existing headwalls to make way for the extension of the culvert.

12.6.11 Backfill – Witness Point – Hold Point

Witness point - Notify the Superintendent before backfilling where holes or fissures occur in rock trenches.

Hold point - Do not place backfill against any in-situ concrete structure until the concrete has attained 80% characteristic strength and approval has been given.

Place backfill in layers not exceeding 150 mm compacted thickness.

Ensure the maximum difference in height of backfill on each side of a culvert is 300 mm.

Backfill around the culvert for the full width of the trench, and for a minimum 300 mm above the top of the culvert, or to subgrade surface if less, with select fill.

Backfill the remainder of the trench with standard fill.

Stabilise all backfill with 2% cement by mass and compact to 95% relative compaction.

Produce a uniform mix. Complete compaction within one hour of adding mixing water.

Use compaction equipment which will not damage the culvert and in-situ structures.
Carry out conformance testing using the Department's Panel Period Contractors for Testing.

Stabilise top 150 mm of backfill, for a distance of 1 m adjacent to culvert headwalls and wing walls, so as to be erosion-resistant.

Remove surplus material from the site.

Reinstate to subgrade level trenches cut through pavements and other construction by backfilling the trench with stabilised select fill compacted to 95% relative compaction.

Construct base/sub-base layers of the pavement in accordance with the PAVEMENTS AND SHOULDERS Section.

Reinstate surface.

Reinstate trenches cut outside of pavements and other construction by backfilling with standard fill compacted to 90% relative compaction.

12.7 INLET AND OUTLET STRUCTURES AND MAINTENANCE HOLES

Construct in accordance with the specifications.

Compact foundations to 95% relative compaction to a depth of 150 mm minimum.

Replace unsuitable material as specified in the EXCAVATION Clause.

12.8 INLET AND OUTLET CHANNELS

Excavate the inlet and outlet of all culverts to facilitate the flow of water.

Conform to the following:

Bed width: Minimum 150 mm greater than overall width of culvert.

Side batters: 45 degrees maximum to horizontal.

Bed grade: 0.5% in the direction of flow for a minimum distance of 50 metres.

12.9 OPEN UNLINED DRAINS

Excavate and dispose of all excess material as specified in the EARTHWORKS Section.

Trim drains to form neat levees.

Compact levees to 95% relative compaction.

Allow natural surface runoff.

12.10 REMOVAL OF EXISTING CULVERTS AND DRAINAGE STRUCTURES

Demolish and remove from the site, as specified, existing culverts and drainage structures.

12.11 SUBSOIL DRAINS – HOLD POINT

12.11.1 Excavation

Excavate below the top of required depth of cover to drainage devices (pipe or other) to a minimum depth equal to the outside diameter of the pipe or height of other device, plus 75 mm.

Line the trench with geotextile fabric. Refer to PROTECTION WORKS.

Place a bedding layer of 50 mm of filter material in the trench and compact with a vibrating plate or similar.

12.11.2 Filter Material

Shall be a hard durable stone having a Los Angeles Abrasion Loss not greater than 35%.

Conform to the grading specified by the manufacturer of the subsoil pipe. If manufacturer's grading not supplied, conform to the table FILTER MATERIAL GRADING.

12.11.3 Table - Filter Material Grading

<table>

</tbody>
</table>

12.11.4 Geotextile Fabric

Conform to the requirements of Geotextile Fabrics in PROTECTION WORKS section.

12.11.5 Subsoil Drain Pipe

Use 100 mm diameter Class 400.

Use compatible couplings and fittings.

Connect solid wall pipe to the subsoil drain pipe for the disposal of collected water.

12.11.6 Laying and Backfilling – Hold Point

Fit the upper end of pipelines with inspection openings and caps supported in a concrete collar.

Hold point - Obtain Superintendent's approval of the pipe installation before backfilling.
Place filter material around the barrel of the pipe and to a height of 200 mm above the pipe. Compact with a vibrating plate compactor or similar.

Place and compact remaining layers of the filter in layers not exceeding 300 mm. Prevent contamination of the filter.

Place and compact basecourse gravel, as specified in the PAVEMENTS AND SHOULDERS Section in the top 300 mm of trench.

Place the material in two equal layers compacted to 95% relative compaction. Where trench excavated through pavement compact upper layer of basecourse gravel to 100% relative compaction and reinstate surface.

Backfill above solid wall pipes as specified in the BACKFILL - TRENCH CONDITIONS clause.

12.11.7 End Walls

Construct end walls at the outlet of subsoil drains as specified.

12.12 CONFORMANCE

Conform to the following:

- Invert level and grade line: No ponding of water.
- Open unlined drains: + or -50 mm.
- Culverts or lined drains: + or -20 mm.
- Plan position: + or -200 mm.
- Culverts parallel to kerbs: + or -50 mm.
- Concrete structure dimension: + or -5 mm.
- Concrete thickness: Not less than specified.
- Subsoil drain slope: 25 mm maximum sag in 8 m.

13 PROTECTION WORKS

13.1 STANDARDS
Conform to the following Standards and Publication unless specified otherwise:

- AS 1012 Methods of testing concrete.
- AS 1141 Methods of sampling and testing aggregates.
- AS 1141.26 Secondary minerals content in basic igneous rocks.
- AS 1141.29 Accelerated soundness index by reflux. Basic igneous rocks.
- AS 1289 Methods of testing soils for engineering purposes.
- AS 1725 Galvanized rail-less chainwire security fences and gates.
- AS 2001.2.3.2 Methods of test for textiles – Method 2.3.2: Physical tests – Determination of maximum force using the grab method.
- AS 2423 Galvanized wire fencing products.
- AS 2758.1 Aggregates and rock for engineering purposes - Concrete aggregates.
- AS 3706 Geotextiles - Methods of test.
- AS 3972 Portland and blended cements.
- AS 4133 Methods of testing rocks for engineering purposes.
- AS/NZS 4671 Steel reinforcing materials.
- AS/NZS 4680 Hot dip galvanized (zinc) on coatings fabricated ferrous articles.
- NTMTM NT Test Methods

13.2 FOUNDATIONS
Excavate, fill and trim the site to the required shape prior to commencing the protection works. Compact the top 150 mm of earthworks, on which protection works are to be laid to 90% maximum dry density ratio (modified).

13.3 GEOTEXTILE FABRICS
13.3.1 General
Supply and lay non-woven polypropylene or polyester geotextile fabric, consisting of long chain synthetic polymers composed of at least 95% by mass of polyolefins or polymers. The geotextile filaments must be rot-proof, chemically stable and must have low water absorbancy. Filaments must resist delamination and maintain their dimensional stability in the geotextile.

Non-woven geotextiles must have filaments bonded by needle punching, heat or chemical bonding processes.

Woven geotextiles must have filaments interlaced in two sets, mutually at right angles. One set must be parallel to the longitudinal direction of the geotextile.

Geotextiles must be free of any flaws which may have an adverse affect on the physical and mechanical properties of the geotextile.

Geotextiles must be stabilised against ultraviolet radiation such that, when tested in accordance with AS 3706.11, must have a retained strength of at least 50% after 500 hours of exposure.

13.3.2 Storage, Packaging and Handling
Geotextiles must be stored under protective cover or wrapped with a waterproof, opaque UV protective sheeting to avoid damage prior to installation.

Geotextiles must not be stored directly on the ground or in any manner in which they may be affected adversely by heat, water or soil. The method of storage must be in accordance with recommendations by the manufacturer.

The protected geotextile rolls must be clearly labelled showing manufacturer, type of geotextile, and batch identification number.

Handle rolls with forklifts or similar, using dedicated slings, free of sharp hooks or tongs. Rolls that are dropped, dragged or pushed around on the ground will be rejected.

13.3.3 Delivery and Product Certification
Geotextile must be delivered to site at least 5 days prior to commencement of installation.

Provide a Certificate of Compliance that the geotextile complies with all the requirements as specified, together with test results reported on NATA endorsed test documents. The certificate must not be more than 12 months old.

The Certificate of Compliance to include: quality control documentation for the relevant batch/lot, physical properties sheet, and manufacturer’s letter of certification stating compliance.

13.3.4 Construction
Prepare smooth surfaces for placement of the geotextile, free of sharp objects, large rocks and protruding vegetation.

Place geotextiles just ahead of the advancing face of construction work, with a maximum of 48 hours of placement prior to covering.

Repair punctures and tears.

Where used in trenches or other drainage configurations, place the geotextile to the shape of the prepared surface, folding and overlapping.
where required. Fully envelope drainage materials in trenches.

Unless specified elsewhere in the contract, the overlap must be minimum 300mm. Overlap to be minimum 500 mm where large ground deformations are expected. Sewing may be permitted provided the seam strength exceeds the parent material grab strength.

Direct travel of machinery over geotextile not permitted.

Where required, conform to the following initial layer of material thicknesses:

<table>
<thead>
<tr>
<th>Nominal Maximum Particle Size $D_{85}$ of Initial Fill Layer (mm)</th>
<th>Minimum Initial Layer Thickness (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt; 150</td>
<td>300</td>
</tr>
<tr>
<td>150 - 300</td>
<td>400</td>
</tr>
<tr>
<td>300 - 500</td>
<td>500</td>
</tr>
</tbody>
</table>

Rock armour placed directly on geotextiles must be placed with a drop height of less than 1.5m, and placed in such a manner so as not to damage, puncture or tear the geotextile.

Obtain Superintendent approval for use of vibratory compaction methods on the initial layer.

13.3.5 Geotextile Grades

Unless specified elsewhere in the contract, use: non-woven, Strength Grade B.

All strength grades, where specified, based on a Characteristic Values ($Q$), to conform to the table:

<table>
<thead>
<tr>
<th>Geotextile Strength Grade</th>
<th>Elongation (1)</th>
<th>Grade Strength (2) (N)</th>
<th>Tear Strength (2) (N)</th>
<th>G Rating (2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>&gt;30% &lt;30%</td>
<td>500</td>
<td>180</td>
<td>900</td>
</tr>
<tr>
<td></td>

<td>4500</td>
</tr>
<tr>
<td>E</td>
<td>&gt;30%</td>
<td>1600</td>
<td>650</td>
<td>4500</td>
</tr>
</tbody>
</table>

Notes:

(1) % Elongation corresponding to max CBR burst strength as per AS 3706.4. Generally <30% for wovens, >30% for non-wovens.

(2) Property value is 80th percentile characteristic value (mean strength – 0.83 x standard deviation), as per relevant AS test.

Filtration properties relevant to each grade to be certified as part of PRODUCT CERTIFICATION clause requirements.

13.3.6 Conformance Testing

Where project requirement is less than 15,000m$^2$, sampling and testing is not required.

Provide samples to independent, NATA accredited testing laboratory when project exceeds 15,000m$^2$, to the following test frequencies:

<table>
<thead>
<tr>
<th>Description</th>
<th>Units</th>
<th>Test Method</th>
<th>Test Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>kN/m</td>
<td>AS 3706.2</td>
<td>1 per 15,000 m$^2$</td>
</tr>
<tr>
<td>Tear Strength</td>
<td>N</td>
<td>AS 3706.3</td>
<td>1 per 15,000 m$^2$</td>
</tr>
<tr>
<td>CBR Burst Strength</td>

<td>AS 3706.4</td>
<td>1 per 15,000 m$^2$</td>
</tr>
<tr>
<td>Grade Tensile Strength</td>
<td>N</td>
<td>AS 2001.2 .3.2</td>
<td>1 per 15,000 m$^2$</td>
</tr>
<tr>
<td>Flow Rate</td>
<td>l/m$^2$/s</td>
<td>AS 3706.9</td>
<td>1 per 90,000 m$^2$</td>
</tr>
</tbody>
</table>

Samples to be 15m$^2$ in size, cut across full width of the roll, not within 2m of the end of a roll.

13.4 ROCK PROPERTIES

The rock properties specified in this clause apply to the rock, stone, aggregate and boulders specified in the following clauses in this section;

- Stone Pitching
- Dumped Rock
- Quarter Tonne Dumped Rock
- Rubble
- Gabion Rock
- Reno Mattresses

REQUIREMENTS: Clean, dry, durable crushed stone of uniform quality, free from noxious weeds, vegetable matter and other deleterious materials.

Particles must have at least 2 crushed faces and comply with the following standards;
13.5 STONE PITCHING – HOLD POINT

13.5.1 Stone Pitching
The stone to be spalls of hard durable rock complying with the ROCK PROPERTIES clause and with no dimension less than 200mm. Hand place the stones so that they are firmly bedded in layers. The average plane of the exposed face to be within 100 mm of the specified plane and all exposed faces of stones to be within 50 mm of the average plane.

13.5.2 Grouted Stone Pitching – Hold Point
Place stones as specified in the STONE PITCHING Clause. Hold point - Obtain Superintendent's approval before grouting. Grout stone pitching with cement mortar. Cement mortar to consist of one part cement to three parts of clean sand mixed with potable water to form a workable mixture. Work the mortar into the interstices of the stone pitching to a depth of at least 100 mm from the surface. Work from the base upwards. Cure the mortar for at least 48 hours. Remove defective mortar and re-grout any loose stones. Provide 75 mm diameter weep holes penetrating the full thickness of the grout at the rate of one every 5 square metres.

13.6 DUMPED ROCK PROTECTION
Large spalls or boulders complying with the ROCK PROPERTIES clause and having a least dimension of that specified in the PROJECT SPECIFIC REQUIREMENTS section of the RFT. Dump into the specified area. Protect adjacent areas from damage due to dumping.

The average plane of the exposed rock face to be within 100 mm of the specified position.

13.7 QUARTER TONNE CLASS DUMPED ROCK PROTECTION
Large spalls or boulders complying with the ROCK PROPERTIES clause and having the following grading.

<table>
<thead>
<tr>
<th>Rock Size</th>
<th>Minimum % Larger Than</th>
</tr>
</thead>
<tbody>
<tr>
<td>35kg</td>
<td>90</td>
</tr>
<tr>
<td>250kg</td>
<td>50</td>
</tr>
<tr>
<td>500kg</td>
<td>0</td>
</tr>
</tbody>
</table>

Dump into the specified area. Protect adjacent areas from damage due to dumping. The average plane of the exposed rock face to be within 100 mm of the specified position.

13.8 RUBBLE
Broken rock complying with the ROCK PROPERTIES clause. Maximum size of rubble to be 200mm. At least 30% by mass to have a nominal size of 100 mm or greater. No more than 20% by mass to pass the 2.36 mm sieve. Dump rubble without segregation onto the prepared area. Compact rubble to a tight finish. The average plane of the exposed face to be within 100 mm of that specified. The exposed face to be within 100 mm of the average plane.

13.9 GABIONS

13.9.1 General
A flexible, hexagonal woven steel wire mesh box, filled with packed stone, complying with the ROCK PROPERTIES clause and securely laced with steel wire.

13.9.2 Steel Wire Mesh
Use galvanized steel wire, Grade W15Z380 to AS 2423. Zinc coating; 250 g/sq.m Galvanization to be carried out prior to weaving of the mesh. Minimum tensile strength of wire: 380 MPa Mesh openings to be 80 mm x 100 mm maximum, hexagonal in shape with flexible joints consisting of not less than two full turns.
All wire to be coated with average thickness of 0.55 mm extruded grey PVC firmly attached to the wire. The minimum thickness of coating to be 0.40 mm in accordance with AS 2423.

At the discretion of the Superintendent, the PVC coating may be omitted where abrasion of wire is not likely to be of concern or where deleterious effects on the wire of ground water, soil salinity, natural weather exposure and water emersion is not significant. Check PROJECT SPECIFIC REQUIREMENTS section of RFT.

Conform to the following wire sizes and galvanizing weights:

### 13.9.3 Table - Wire Properties, Gabions

<table>
<thead>
<tr>
<th>Wire Type</th>
<th>Minimum Diameter (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Body wire</td>
<td>2.7</td>
</tr>
<tr>
<td>Binding and lacing wire</td>
<td>2.2</td>
</tr>
<tr>
<td>Selvedge wire</td>
<td>3.4</td>
</tr>
</tbody>
</table>

Selvedge wire shall be woven integrally along all edges of the mesh, in accordance with the manufacturer's instructions, and such that the mesh shall not unravel.

The steel wire mesh shall be sized so that it can be folded into regular boxes, complete with diaphragms, having dimensions specified. Diaphragms to be at 1,000 mm spacings.

### 13.9.4 Construction

Assemble and erect in accordance with the manufacturer's instructions.

Pretension the wire framework against a firm anchor or adjacent units.

Retain the shape of the wire framework with spreaders.

Fill with hard durable stone, complying with the ROCK PROPERTIES clause and placed in stages to achieve the tightest packing of stone.

Maximum stone dimension: 250mm.

Minimum stone dimension: 100mm.

Overfill the framework by 20 mm to 50 mm to allow for subsequent movement of the stone.

Perform lacing operations using specified lacing wire. Wire to pass round the edges being joined using alternative single and double loops through each mesh in turn. Tightness of the mesh and wiring is essential.

Ensure a tightly packed, neat and uniform construction.

### 13.10 RENO MATTRESSES

#### 13.10.1 General

A flexible, hexagonal woven steel wire mesh box, filled with packed stone, complying with the ROCK PROPERTIES clause and securely laced with steel wire.

#### 13.10.2 Steel Wire Mesh

Use galvanized steel wire, Grade W15Z380 to AS 2423.

Zinc coating; 250 g/sq.m. Galvanization to be carried out prior to the weaving of the mesh.

Minimum tensile strength of wire: 380 MPa.

Mesh openings to be 60 mm x 80 mm maximum, hexagonal in shape with flexible joints consisting of not less than two full turns.

All wire to be coated with average thickness of 0.55 mm extruded grey PVC firmly attached to the wire. The minimum thickness of coating to be 0.40 mm in accordance with AS 2423.

At the discretion of the Superintendent, the PVC coating may be omitted where abrasion of wire is not likely to be of concern or where deleterious effects on the wire of ground water, soil salinity, natural weather exposure and water emersion is not significant. Check PROJECT SPECIFIC REQUIREMENTS section of RFT.

Conform with the following wire sizes and galvanizing weights:

### 13.10.3 Table - Wire Properties, Reno Mattresses

<table>
<thead>
<tr>
<th>Wire Type</th>
<th>Minimum Diameter (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Body wire</td>
<td>2.0</td>
</tr>
<tr>
<td>Binding and lacing wire</td>
<td>2.2</td>
</tr>
<tr>
<td>Selvedge wire</td>
<td>2.4</td>
</tr>
</tbody>
</table>

Selvedge wire to be woven integrally along all edges of the mesh, in accordance with the manufacturer's instructions.

Cut to shape where necessary.

#### MATTRESS PANELS

**Bottom panel:** Includes both sides and both end panels.

**Top panel:** Shall have the same dimension as the bottom, without the sides and ends, and be supplied separately.

**Diaphragms:** Extend over the full width of the mattress from top to bottom at maximum intervals of 1 m.
13.10.4 Construction
Assemble and erect in accordance with the manufacturer's instructions.
Align diaphragms perpendicular to the direction of flow unless otherwise specified.
Pretension the wire framework against a firm anchor or adjacent units.
Retain the shape of the wire framework with spreaders.
Fill with hard durable stone complying with the ROCK PROPERTIES clause and placed in stages to achieve the tightest packing of stone.
Maximum stone dimension:
120 mm when mattress depth 170 mm.
150 mm when mattress depth 230 mm.
200 mm when mattress depth 300 mm or greater.
Minimum least stone dimension: 80 mm.
Overfill the framework by 20 mm to 50 mm to allow for subsequent movement of the stone.
Perform lacing operations using specified lacing wire. Wire to pass round the edges being joined using alternative single and double loops through each mesh in turn. Tightness of the mesh and wiring is essential.
Last panel on downstream side, or at base of slope, shall be a whole unit (i.e. not cut).
Ensure a tightly packed, neat and uniform construction.

13.11 REVETMENT MATTRESSES

13.11.1 General
A nylon fabric material filled with mortar with filter points for the relief of hydrostatic uplift pressure.
Conform to the manufacturer's instructions.

13.11.2 Materials
Mortar mix proportions:

<table>
<thead>
<tr>
<th>Table – Mortar Mix Proportions – Revetment Mattresses</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cement Type GP or GB</td>
</tr>
<tr>
<td>1 (500kg) (500kg)</td>
</tr>
</tbody>
</table>

Adjust fine sand/coarse sand proportions if required to provide workable mix.

13.11.3 Construction
Toe-in to provide cut-off walls minimum 300 mm deep and width not less than maximum thickness of mattress.
Lay, cut and stitch mattress on prepared surface. Make allowance for take up of fabric resulting from filling mattress with mortar.
All stitching and seams to be neat in appearance and strength to withstand filling pressure.
Ensure mattress is anchored prior to mortar pumping to prevent creep during placement of mortar.
Provide openings in fabric at a maximum of one every 50 m2 for placement of mortar. Opening to match size of pumping hose.
Make good openings on completion of mortar pumping.
All areas of mattress to be hard filled with mortar with smooth surface.
Do not permit any loading on the mattress until one hour after mortar pumping has been completed.
Remove spilt mortar from surface of mattress by hand only. Do not use water to wash spilt mortar.
Make good any defective areas.
13.12 EMBANKMENT PROTECTION - CONCRETE

Construct embankment protection from concrete reinforced with a single layer of centrally located SL62 mesh.

Overlap the mesh by 200 mm at joints.

Make construction joints in the vertical plane, at 2m maximum spacing.

Continue reinforcement mesh across construction joints.

Where margins are required, construct the embankment protection and the margins as an integral unit.

Where there are adjacent protection works, construct the toe of the embankment protection and the adjacent protection work as an integral unit.

Drainage holes to be 75 mm diameter penetrating the full thickness of the protection works. Install the drainage holes at 3m intervals just above the toe.

Install additional rows of drainage holes parallel to the first, and at 3m intervals and spacings, where the scope of work requires it.

The exposed surface to be within 50 mm of the specified position.

13.13 MARGINS

Construct margins with reinforced concrete. Conforming to the requirements of the MISCELLANEOUS CONCRETE WORKS Section.

Make construction joints at 3m maximum spacing.

Form the top 75 mm of the vertical face nearer the pavement, and any exposed outer face, true to line and level.

Wood float and broom finish the upper surface of the margin. Finish flush with the top of the pavement.

Where adjacent pavement is sealed, overlap the bituminous seal on the margins by not less than 100 mm.

TOLERANCES

Width: Not less than specified.

Level: + or – 10 mm of top of adjacent pavement.
14 ROAD FURNITURE AND TRAFFIC CONTROL DEVICES

14.1 STANDARDS
Conform to the following Standards and Publication unless specified otherwise:

- AS 1012 Set Methods of testing concrete
- AS 1074 Steel tubes and tubulars for ordinary services
- AS/NZS 1111 ISO metric hexagon commercial bolts and screws
- AS/NZS 1112 ISO metric hexagon nuts, including thin nuts, slotted nuts and castle nuts
- AS 1273 Unplasticised PVC (UPVC) downpipe and fittings for rainwater
- AS 1397 Steel sheet and strip hot dipped zinc coated or aluminium/zinc coated
- AS/NZS 1554 Structural steel welding (Set)
- AS/NZS 1594 Hot rolled steel flat products
- AS 1604 Timber – Preservative treated – Sawn and round
- AS 1722 Pipe threads of whitworth form
- AS 1725 Galvanized rail-less chainwire security fences and gates
- AS/NZS 1734 Aluminium and aluminium alloys - Flat sheet, coiled sheet and plate
- AS 1743 Road signs - Specifications
- AS 2423 Coated steel wire fencing products for terrestrial, aquatic and general use
- AS/NZS 4680 Hot dip galvanized (zinc) coatings on fabricated ferrous articles
- APAS 1441/1 Permanent graffiti barrier, clear, exterior
- APAS 1442/1 Temporary graffiti barrier, clear, exterior
- APAS 1443 Graffiti Remover

14.2 DEFINITIONS
GRAFFITI: The name for images or lettering scratched, scrawled, painted or marked in any manner on property.
LONGITUDINAL LINES: Any line which runs parallel to the road centre line, e.g. broken line, edge line, separation line, barrier line.
OTHER MARKINGS: All diagonal lines, chevron markings and messages on the pavement, including symbols, words, numerals, arrows and kerb markings.

TRAFFIC CONTROL DEVICE: Any sign, signal, pavement marking or other installation placed or erected for the purpose of regulating, warning, guiding or providing for the safety of road users. It does not include temporary warning devices and control measures erected only for the construction period.
TRANSVERSE MARKINGS: Any line which is at right angles to the centre line of the road, e.g. stop line, hold line, pedestrian cross walk

14.3 FENCING
14.3.1 General
Clearing fence lines includes the removal of trees, shrubs, vegetable matter and debris. Grub out all roots that interfere with the placement of posts.
Erect fences so that the line of the tops of the posts is uniform.
Adjust the position of posts to compensate for the irregularities of the ground.
Provide gates where specified and across existing access tracks or roads.

14.3.2 Existing Fences
Install a post at the intersection of new fence with existing fence and fix the wiring of both fences to that post.
Complete the necessary sections of new fencing before removing or opening a boundary or internal fence.
Obtain the owners agreement to the proposed fence removal and advise the owner or occupier in writing of the date the fence will be removed.
Erect gates or grids at fence openings as specified.

14.3.3 Materials
Barbed wire: 1.57 mm diameter minimum, high tensile.
Plain wire: 2.50 mm diameter minimum, high tensile.
Wire mesh: Galvanized 3.15 mm diameter x 50 mm chain mesh.

14.3.4 Stock Fence
Stock fencing to consist of tubular steel strainer assemblies with star pickets and galvanized wire. Construct as specified.
Include the crossing of gullies, watercourses and hollows on the ground.
Refer to standard drawing CS-1306-5.
14.3.5 Security Fence
Security fencing to consist of tubular steel posts complete with post caps, cable straining wires, chainwire mesh and three barbed wires. Construct as specified. Refer to standard drawing CS 1303-1.

14.3.6 Safety Fence
Safety fence to consist of "HUMEARC" type SWP HRI x 3 m panels or similar. Erect the fence in accordance with manufacturer’s specifications.

14.3.7 Log Barrier Fence
Provide log barrier fencing consisting of timber posts and rails complete with connections. Construct as shown in the typical details. Use stringybark, woollybutt or pine timber, pressure impregnated with ACQ preservative formulation, copper oxide (CuO) and quaternary ammonium compound (DDAC) to Category H4 of AS 1604. Do not use preservative treatments that contain arsenic or chromium. Refer to standard drawing CS-1302-2

14.4 GUIDE POSTS
14.4.1 Posts
Use THERMOPLASTIC guide posts manufactured from plastic alloy ASA/PC or similar. Refer to standard drawing CS 1300-1.

REQUIREMENTS
Posts to conform to the following:
- Colour: Opaque white.
- Finish: Smooth, glossy.
- Length: 1380 mm.
- Width: 95 mm minimum, 105 mm maximum, width to be constant to within 1 mm.
- Web thickness: 3 mm minimum, 5 mm maximum.

Provide certification that guide posts conform to the following:
- Where installed in normal working conditions, guide posts are capable of self erecting after 10 impacts head on, from an average sedan travelling at 60 kilometres per hour.
- After 2,000 hours of exposure in an Atlas Weatherometer the guide posts do not change colour by more than 10 points on a Delta E colour chart.
- The guide post material has a minimum vicat softening point of 120°C.
- Physical testing as specified.
- Resistant to termites.

Guide posts to have the following:
- An anti-withdrawal device which will prevent the guide post from being withdrawn without dislodgement of the compacted backfill.
- Legible and indelible markings similar to those used to mark UPVC sewer and water pipes, in letters no less than 5 mm high, showing month and year of manufacture and located approximately 400 mm from the top of the post.
- Legible and indelible marking 380 mm from the bottom of the guide post, to indicate depth for installation.

14.4.2 Delineators
RECTANGULAR RETROREFLECTORS
Class 1 retroreflective material. Size to be 100 mm x 50 mm minimum for red delineators; 100 mm x 25 mm minimum for white delineators.
CORNER CUBE RETROREFLECTORS
Minimum face area for red and white delineators to be 4,400 square millimetres.

14.4.3 Installation
Attach one red and one white delineator to each guide post, 50 mm from the top of the post. The red delineator to be attached to the convex side of curved guide posts where applicable. Attach any corner cube delineators required as specified. Red delineators to be on the left and white delineators to be on the right when viewed in the direction of travel.

14.5 ROAD SIGNS – HOLD POINT
14.5.1 General
This subsection specifies the manufacture, supply, delivery and erection of road signs.

14.5.2 Materials – Hold Point
NON-REFLECTIVE MATERIALS
In accordance with AS 1743.
REFLECTIVE MATERIAL
Use high intensity Class 1 standard in accordance with AS 1906.1 for all signs, including temporary signs, and hazard markers with the exception that all black legends are to be non-reflective.
BLANKS
Use aluminium marine grade alloy designation 5052 - H38. Thickness 1.6 mm. Steel sheets may only be used for temporary signs.

MANUFACTURE
Chemically clean aluminium blanks before painting or bonding of reflective material. Stamp the month and year of manufacture and the symbol DoI on the backs of all signs.

POSTS
Post sizes to conform to the table ROADSIDE SIGNS - MOUNTING SELECTION unless specified otherwise. See PROJECT SPECIFIC REQUIREMENTS in the RFT.

Post sizes to be medium grade galvanized pipe with plain ends and constructed from a single length of pipe. Cap each post with a galvanized cap. Do not use "Ingal" posts.

Standard; to AS 1074.

ANTI-GRAFFITI COATING

Hold Point – Obtain Superintendent’s approval for the use of anti-graffiti film or coating products. Apply anti-graffiti products only to the new road signs specified by the Superintendent.

14.5.3 Supply and Delivery
Supply all brackets, bolts, nuts and bracings. Fix bracings to the signs prior to delivery.

14.5.4 Location

Signs to be located clear of vegetation and be clearly visible under headlight illumination.

LATERAL PLACEMENT
Lateral placement to be measured to the edge of the sign nearest the road. Lateral placement to be as follows:

Lateral placement:
- Unkerbed roads: 2 to 4 m clear from the edge of the traffic lane, and 600 mm minimum clear from the outer edge of the road shoulder.
- Kerbed roads: 500 mm to 1000 mm from the front face of the kerb.

HEIGHT
Height to be measured as the clearance to the lowest edge of the lowest sign in an assembly. Heights for signs to be as follows:

Table – Heights for signs

<table>
<thead>
<tr>
<th>Unkerbed Roads</th>
<th>Kerbed Roads:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fingerboard (G3) and street name signs (G5):</td>
<td>Signs overhanging a footway: 2.5 m minimum above footway.</td>
</tr>
<tr>
<td></td>
<td>Signs not overhanging a footway: 1 m to 1.5 m clearance except for those specific signs on medians and islands given below.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table – Height of specific signs on medians and islands</th>
</tr>
</thead>
<tbody>
<tr>
<td>The following signs, when used on medians and islands, to have a clearance 150 mm above the kerb:</td>
</tr>
<tr>
<td>D4-1-2 Hazard Marker</td>
</tr>
<tr>
<td>D4-2-2 Hazard Marker</td>
</tr>
<tr>
<td>D4-3 Hazard Marker</td>
</tr>
<tr>
<td>R2-3 (Keep Left) (Keep Right)</td>
</tr>
<tr>
<td>R2-5 (No U Turn)</td>
</tr>
<tr>
<td>R2-6 (No Right Turn) (No Left Turn)</td>
</tr>
<tr>
<td>R2-15 (U Turn Permitted)</td>
</tr>
</tbody>
</table>

14.5.5 Installation

Conform to the table ROADSIDE SIGNS - MOUNTING SELECTION.

Install posts vertically. Provide and install galvanised steel sleeves when installing sign posts in concreted or paved locations. Sleeves, when specified, to be 50 mm longer than the specified ground anchor depth and extend 50 mm above the finished surface level.

Attach the post to the sleeve with a galvanized M10 bolt, 25 mm from the top of the sleeve. Encase the post, or sleeve when used, in a footing of 20 MPa concrete.
Orientation of sign face:
Vertical, and turned 3 degrees to 5 degrees horizontally from oncoming traffic on straight sections. On curves, at right angles to centre line of road.
Exception:
Parking signs to be oriented 5 degrees from parallel to the kerb to face oncoming traffic.

14.5.6 Reinstatement and Relocation of Existing Signs
Dismantle existing post and signs carefully.
Store in a manner to prevent damage.
Backfill the hole left by the post and its footing and compact the fill to the same density as the surrounding area.
Erect signs in new locations as shown on the drawings.

14.5.7 Table - Roadside Signs - Mounting Selection
Refer to Clause 14.9 for Tables

14.5.8 GENERAL REQUIREMENTS
- Spacing between posts:
  - 2 post signs - 0.6 times sign width.
  - 3 post signs - 0.4 times sign width.
  - 4 post signs - 0.3 times sign width.
- Brace spacing to be 380 mm maximum.
- Adopt the nearest size in the list for intermediate sizes.
- Post sizes for galvanized pipe posts are for sign clearance of less than 2 m above the pavement. For sign clearances greater than 2 m, increase the nominal diameter of the pipe size by a percentage equal to the percentage increase in height above 2 m.
- Where signs are erected in groups treat the overall dimensions of the group as one sign size to determine the post requirement from the table ROADSIDE SIGNS - MOUNTING SELECTION.

14.6 FLOOD GAUGE POSTS

14.6.1 Posts and Gauges
Use a standard flood gauge in accordance with Standard Drawing CS 1301-3.
Use galvanized posts, single length 150 mm x 50 mm x 3 mm RHS with a 3 mm end cap welded to the top.
Paint welds with zinc rich organic paint to APAS specification 2916.

14.6.2 Installation
Erect the post vertically at the outer edge of the road shoulder or margin, on the left hand side when viewed in the direction of travel.
Install a concrete anchor, of 20 MPa concrete, with a depth of 650 mm and a diameter of 300mm.
Cast a suitable galvanized sleeve, 650 mm in length, in the anchor so that the sleeve extends 50 mm above the finished surface level.
Attach post to sleeve with a galvanized M10 bolt 25 mm from the top of the sleeve.
Secure gauge to post with No 10 galvanized Tek screws or 4 mm blind pop rivets at 300 mm centres staggered alternately each side.
Position gauge zero to comply with lowest spot on floodway along the centre line.

14.7 CATTLE GRIDS
Construct grids to the details shown on the drawings. Refer to standard drawing CS 1315-2.
Place the grid centre line on the centre line of the road pavement.
The grid grade and levels to conform to the grade and levels of the adjacent road pavement.
Place and compact select fill behind the abutments of the grid, up to the base of the pavement.
Reinstate pavement layers with base material.
Reinstate surface.
Tighten all hold down bolts as specified.
Paint the portion of guardrails above ground with one coat zinc phosphate primer and two coats of white alkyd paint.
Fix width markers with epoxy adhesive to each guardrail.
Construct strainer post assemblies as specified.
Fix the stock fence to the strainer assembly.
Supply and install a gate in the fencing adjacent to the grid as specified.
Refer to standard drawings CS 1306 and CS 1317.

14.8 STEEL BEAM GUARDRAIL

14.8.1 Materials
RAILS
Use W-beam guardrail similar to ‘Armco Flex Beam Guardrail’ (nominal 300 mm width) or similar formed from HA 350 steel.
Rails to be capable of withstanding a cold bend of 180 deg. around a diameter 2.5 times its own thickness without cracking.
Metal thickness to be 2.7 mm minimum.
TERMINAL SECTIONS
Form from HA 350 steel having the same properties and thickness as the rails.

POSTS
Fabricate posts and block outs from steel channel section in accordance with standard drawing C(S) 1310.

BOLTS AND NUTS
Shape bolt shoulders and holes in rail elements to prevent the bolts from turning.
Length of bolts to be sufficient to extend 6 mm to 12 mm beyond the nuts.

GALVANIZING
Galvanize all components by hot dip galvanizing, after fabrication, to AS 4680.

14.8.2 Installation
Erect the rail in a manner that produces a smooth, continuous, taut rail closely conforming to the line and grade of the roadway.
Lap rails so that the ends of rails do not face oncoming traffic in the adjacent lane.
Attach reflective delineators to the guardrail in accordance with the manufacturer’s specification.
Refer to standard drawing CS 1310.

15 PAVEMENT MARKING

15.1 GENERAL

This section specifies the materials, testing and standards of workmanship for marking of pavements with road marking paint and/or thermoplastic material, including glass beads.

15.2 STANDARDS

Conform to the following Standards and Publication unless specified otherwise:

AS/NZS 1580 Set Paints and related materials - Methods of test
AS/NZS 1580.205.4 - Application properties - Airless spraying
AS 1742 Set Manual of uniform traffic control devices
AS 1744 Forms of letters and numerals for road signs
AS/NZS 1906 Retroreflective materials and devices for road traffic control purposes
AS/NZS 1906.1 Retroreflective sheeting
AS/NZS 2009 Glass beads for road marking materials
AS/NZS 2310 Glossary of paint and painting terms
AS/NZS 2311 Set Guide to the painting of building
AS/NZS 2433 Plastics - Method for exposure to ultraviolet lamps
AS 2700 Colour standards for general purposes
AS 3730 Set Guide to properties of paints for buildings
AS/NZS 3750.22 Paints for steel structures – Full gloss enamel – Solvent-borne
AS 4049.2 Paints and related materials -Thermoplastic road marking materials
AS/NZS 4049.3 Paints and related materials - Road marking materials - Waterborne paint - For use with surface applied glass beads
APAS 0041/4 Road marking paint, thermoplastic
APAS 0041/5 Road marking paint, water borne
APAS 0042 Glass beads for pavement marking paint
NTMTM NT Materials Testing Manual
NTTM NT Test Methods

15.3 DEFINITIONS

ATLM Audio Tactile Line Marking
LONGITUDINAL LINES:
Any line which runs parallel to the road centre line, e.g. broken line, edge line, separation line, barrier line.

OTHER MARKINGS:
All diagonal lines, chevron markings and messages on the pavement, including symbols, words, numerals, arrows and kerb markings.

PCCP Painting Contractors Certification Program.

TRAFFIC CONTROL DEVICE:
Any sign, signal, pavement marking or other installation placed or erected for the purpose of regulating, warning, guiding or providing for the safety of road users. It does not include temporary warning devices and control measures erected only for the construction period.

TRANSVERSE MARKINGS:
Any line which is at right angles to the centre line of the road, e.g. stop line, hold line, pedestrian cross walk.

15.4 CONTRACTOR ACCREDITATION

All pavement marking work must be carried out by a contractor accredited to the “Painting Contractor Certification Program” (PCCP) in a class or category applicable to the work. The PCCP is administered by the CSIRO.
Information regarding the PCCP can be obtained at http://www.apas.gov.au/pccp/

15.5 ROAD MARKING PAINT – WITNESS POINT

Road marking paint: Approved water based white road marking paint conforming to APAS 0041/5 and suitable for application by spray equipment in accordance with Test Method AS/NZS 1580.205.4 to asphalt and bituminous seal road surfaces and for use with Intermix drop-on spherical glass beads.

Australian Paint Approvals Scheme (APAS) Specifications: For paint types identified by an APAS specification code, conform to the specification represented by that code.

Witness Point - Submit a 'Certificate of Compliance' of the paint with the relevant Australian Standards or APAS specification.
15.6 THERMOPLASTIC MATERIALS

Thermoplastic road marking material must consist of aggregate, pigment, binder, glass beads and extenders, capable of being softened by heating and hardened by cooling.

Thermoplastic road marking materials must comply with AS 4049.2.

15.6.1 Audio Tactile Markings

Thermoplastic used for audio tactile pavement markings must comply with AS 4049.2 but modified as follows:

- Softening Point: When determined in accordance with AS2341.18 the softening point shall be not less than 95°C.
- Cold Flow: When determined in accordance with AS 4049.2:2005 Appendix I – Determination of flow resistance - the cold flow shall be no more than 5% at 40°C.
- Skid Resistance: When tested in accordance with AS 4049.2:2005 Appendix K – Field tests for thermoplastic pavement marking material – and Appendix L – Field determination of skid resistance (wet pendulum method) - at any time up to 3,000,000 vehicle passes, the skid resistance value of beaded unprofiled base material must be not less than 50.
- Retro-reflectivity: Mix glass beads in accordance with AS 2009 Type C into the thermoplastic material at a rate of not less than 30% by mass prior to application.

Table – Glass Beads Size Distribution

<table>
<thead>
<tr>
<th>Sieve Size (Microns)</th>

<td>010</td>
<td>-</td>
</tr>
</tbody>
</table>

15.7 GLASS BEADS – WITNESS POINT

Use Intermix glass beads conforming to AS/NZS 2009 and APAS specification 0042 with the exception of size, and conforming to the size distribution requirements in Table – Glass Beads Size Distribution.

Witness Point - Submit a ‘Certificate of Compliance’ of the glass beads with the relevant Australian Standard and APAS specification.

15.8 SETTING OUT

New work: Set out line marking to the line pattern specified in accordance with the standard drawing for LINE MARKING, CS 1520-4 and in accordance with AS 1742 including the setting out of arrows, letters, numerals and chevrons.

Remarking: Remark along the line of the existing line marking and to the tolerances specified for new work.

15.9 APPLICATION – WITNESS POINT – HOLD POINT

Hold Point - Equipment: Apply the marking materials using a self-propelled mobile sprayer, hand sprayer, hand painting or hand screeding as directed by the Superintendent.

Witness Point - Produce documented evidence to show that the spraying equipment has been calibrated in accordance with NTTM 405.1.

Maximum application speed for Intermix glass beads is 12 km/hr.

Apply glass beads by low pressure or delivered by gravity dispenser.

The application rates specified for glass beads are the amounts that are retained in the painted surface after 3 weeks of trafficking.

Produce markings free from ghosting and raggedness on the sides and ends and parallel with the general alignment of the carriageway with the lines level, uniform and free from streaks.

Substrate: Ensure that the road surface is free from dirt, loose detritus, mud and other extraneous matter, and is dry before and after painting operations.
15.9.1 Table - Application Rates – Road Markings

</tr>
<tr>
<td></td>
<td>&gt; 300g/m²</td>
<td>&gt; 300g/m²</td>
</tr>
</tbody>
</table>

15.10 LONGITUDINAL APPLICATION

Apply paint evenly to the road surface at the specified film thicknesses (Tolerance + 0.05 mm) and not more than five seconds after spraying apply the intermix glass beads. Ensure that the loss in glass beads after three weeks traffic does not exceed ten per cent of total applied.

On all work, apply one coat of paint and glass beads to the road in the direction of traffic flow, where possible.

For remarking, apply one coat of paint and glass beads to the surface in the direction of traffic flow, where possible.

Transverse and Other Marking Applications: Apply paint evenly to the road surface to the specified film thickness and immediately after apply an even application of ‘drop-on’ glass beads at the specified rates.

Hold Point - Remove defective marking by sand blasting, or other approved methods, make good the surface in a manner approved by the Superintendent.

Protect all applications from traffic until the binder has hardened sufficiently to retain the glass beads.

Reinstate pavement markings that are damaged by traffic during paint drying time and remove all tyre pickup marks.

15.11 TOLERANCE

Ensure the distance between the centre line of the marking and the centre line of the set out mark is less than 30 mm. The apparent line of the markings is a smooth continuous alignment when viewed in the direction of the line. Permitted tolerance for the length, width and spacing of all pavement markings: +/- 10 mm.

15.12 WORKMANSHIP – HOLD POINT

Set out markings so that they are straight, with smooth even curves where necessary. Remove any marking material beyond the defined marking leaving a neat and smooth marking on the pavement.

Wear assessment limits: The degree of wear is defined as the area of pavement marking remaining after a period of time, relative to the initial area of the pavement marking.

Degree of wear: At the Superintendent’s discretion determine the degree of wear using Image Analysis in accordance with AS 4049.3:2005 Appendix K, Method A, Photographic Method.

Wear limits for pavement marking: 95% intact area after six months.

Remark pavement marking that does not conform to the specified limits at the Contractor’s expense including the costs of all testing.
15.14 RESEALING CONTRACTS

Conform to the following requirements for resealing work including enrichments, spray sealing, rejuvenation and emulsion coats. Conform to the requirements of the PAVEMENT MARKING clauses.

15.14.1 Panel Contractors

The Principal has in place a Panel Contract with approved line marking companies. The selection of the Panel Contractors for particular contracts is made on a rotating basis and the Superintendent will advise of the name and contact details of the Panel Contractor to be used on this contract. The Principal will pay the Panel Contractor direct for the pavement marking work.

15.14.2 Co-ordination of Pavement Marking Work

The Contractor is responsible for co-ordination of the pavement marking work. Make all arrangements necessary with the pavement marking Panel Contractor to meet the following requirements:

For urban work, complete the pavement marking within two days of resealing work.
For rural work, complete the pavement marking within four days of resealing work.

Retain all traffic control and warning devices necessary until pavement marking is completed. Record all localities and extent of pavement marking to reinstate to existing arrangements. Provide this information to the panel contract line marker and co-ordinate all pavement marking works.

15.15 AUDIO TACTILE LINE MARKING (ATLM)

15.15.1 Site Preparation

Immediately prior to marking application, remove all extraneous or loose material from areas where the thermoplastic material is to be applied. Prepare and prime areas as recommended by the manufacturer to ensure satisfactory adhesion of thermoplastic material.

15.15.2 Application

Apply ATLM directly on to the road surface on existing painted edge lines or centre double barrier lines. Apply markings within the tolerances specified in Table – AUDIO TACTILE MARKING TOLERANCES. The height of the thermoplastic raised ribs is measured from the planed surface formed by the tops of the aggregate.

15.15.3 Retro-reflectivity

Apply glass beads in accordance with AS 2009 Type B immediately to the surface of the molten thermoplastic material. The minimum rate to be retained on the thermoplastic material is 200g/m².

When tested in accordance with AS 4049.2:2005 Appendix K - Field tests for thermoplastic pavement marking material – and Appendix M – Determination of retroreflectivity, marking must achieve a minimum level of reflectivity of 350 mcd/lux/m² at time of application.

15.15.4 Table – Audio Tactile Line Marking Tolerances

</tbody>
</table>
15.16 RAISED RETROREFLECTIVE PAVEMENT MARKERS (RRPMS)

15.16.1 Materials
Use STIMSONITE 953 markers fixed to the road surface as recommended by the manufacturer of the marker.
Use adhesives as recommended by the manufacturer.
Use adhesives within the time recommended by the adhesive manufacturer.

15.16.2 Pavement Preparation
Ensure each RRPM site is free of dirt, oil, grease, paint and any other material which would affect the bond of adhesive to the pavement.
Abrasive blast, chip, or burn pavements that cannot be cleaned by sweeping.
Check the moisture content of the surface immediately before application by the polyethylene film moisture test.
Do not place markers if the film moisture test indicates the presence of moisture.

15.16.3 Placing Markers
Place markers in accordance with the manufacturer’s directions.
Use marker types as follows:
Centre line: White, two way reflectors.
Lane line: White, one way reflectors.
Left edge line: Red, one way reflectors.
Right edge line adjacent to medians on dual carriageway.
Roads: Yellow, one way reflectors.
Place the reflectors to face the oncoming traffic.
Do not obscure the reflective faces by adhesive.
Ensure that the surface finish is smooth.
Discard markers which are not positioned correctly within the time recommended by the manufacturer for use of the adhesive. Remove adhesive from the road surface.
Do not place markers over joints in concrete pavement.
For reseal works where the existing seal has excess binder, or where Gilsabind is used:
- Clean the road surface to expose the aggregate prior to installation of RRPMs.
- Protect the RRPMs from traffic until the adhesive is fully set.
- Locate the RRPMs to the outside of edge lines.

15.17 REMOVAL OF EXISTING MARKINGS – HOLD POINT
Hold Point – Obtain approval from the Superintendent on the method used for line marking removal.
Removal of pavement marking must not adversely affect the integrity of the road surface.
When arrows, letters or figures are to be removed or temporarily blacked out, the removal pattern must be in the shape of a rectangle or square to minimise confusion to the motorist, particularly in wet weather or poor lighting conditions.
Remove all materials and debris from removal operations and dispose at an authorised disposal site. Repair any surface defect caused by the removal process at no additional cost to the Principal.
The following methods may be considered and will be dependent on the type of surface, extent and application.

15.17.1 Machine Grinding
This method may be considered for use on smaller removal jobs where surface finish is not a concern. Can be used on most asphalt and concrete surfaces.

15.17.2 Sandblasting
Sandblasting is the preferred method for marking removal on asphalt and concrete surfaces.
Use a skirt or guard around the blaster to minimise the spraying of material away from the immediate work area.
Remove waste material before it can be transported by rain, wind or traffic. This will generally require the use of a vacuum attachment operating concurrently with the blasting operation or alternative method approved by the Superintendent.

15.17.3 Sealing
Spray sealing is the preferred method for sprayed seal surfaces. Conform to specification requirements covered under the SPRAY SEALING FOR MAINTENANCE section.

15.17.4 Paint Blackout
Paint blackout may be considered as a temporary measure only as markings retain a high reflection and possess low skid resistance.

15.17.5 Other Methods
Other methods such as water blasting, heat lance or paint stripping may also be considered by the Superintendent.

15.17.6 Raised Reflective Pavement Marker Removal
Where required, remove raised pavement markers by breaking the bond between the adhesive, the road surface and the base of the raised pavement marker.
Repair all divots caused by the removal of raised pavement markers with hot melt adhesive or epoxy adhesive to the level of the surrounding pavement.
16 LANDSCAPE

16.1 STANDARDS

Conform to the following Publications unless specified otherwise:

AS/NZS 3500 Plumbing and drainage
AS 4419 Soils for landscaping and garden use.

Specification Reference
Refer to the Northern Territory Government Standard Specification for Environmental Management and to the RFT.

Defects liability period for landscape works is to be a minimum of 13 weeks from practical completion of the entirety of the works under the contract, or the same as the defects liability period as for the entirety of the works if that period of time is longer or finishes later. Refer to PROJECT SPECIFIC REQUIREMENTS section of the RFT.

16.2 DEFINITIONS

CERTIFIED SEED:
Seed by record of origin, purity, and strain and conforming in character to the parent stock.

EXOTIC PLANTS:
Any plants not native to Australia.

FINE TILTH:
The friable soil resulting from cultivation.

GERMINATION PERCENTAGE:
The proportion of pure seed germinating in a fixed time under standard laboratory conditions.

MULCH:
Stable material spread as a surface treatment to reduce soil erosion, water loss, and weed invasion.

NATIVE PLANTS:
Plants that are natural to Australia.

NPK RATIO:
The ratio of Nitrogen (N), Phosphorus (P), and Potassium (K) in a fertiliser compound.

ROOT BALL:
The finely bound fibrous root and soil removed intact from the container with the plant.

SHALL:
The term ‘shall’ is indicative of a mandatory requirement unless the context clearly indicates otherwise.

SOIL BINDING AGENT:
Material which stabilises and conditions soil and aids moisture retention.

16.3 MATERIALS

16.3.1 Trees, Shrubs and Ground Covers

Provide trees, shrubs and ground covers which have the following characteristics:
- Trunks/stems to be sturdy and well hardened.
- A well developed vigorous root system.
- A minimum of three months in their container.
- Be sound, healthy, vigorous, and free from insect pests, plant diseases, sun scalds, fresh abrasions of the bark, or other disfigurements.

16.3.2 Grass

Seed shall be covered by an appropriately numbered seed analysis report or certificate cross referenced to the number on the seed sacks.

Seed shall be used only if its report or certificate has been issued within the previous six months.

Seed used shall be true to label.

Seed shall have minimum germination of 80%.

Seed shall comply with the following purity characteristics:
- Clean seed, minimum 94% by weight.
- Weed seed, maximum 0.2% by weight.
- Other crop seed, maximum 0.8% by weight.
- Inert matter, maximum 5.0% by weight.
- Shall not contain any Hyptis Sauveolens, Sida Acuta, Sida Cordifolia.

Seed mixes shall conform to the table SEED MIXES.

16.3.3 Table - Seed Mixes

Refer to Clause 15.9 for Tables

16.3.4 Fertiliser

Fertilisers shall be stored in waterproof sealed bags under shelter away from water and direct sunlight.

Fertilisers shall conform to the table FERTILISERS.

16.3.5 Table – Fertilisers

Refer to Clause 15.9 for Tables
Imported topsoil shall conform generally to AS 4419 and the following requirements:
- Be free draining.
- Be red-brown or black sandy loam.
- Contain no grass or weed growth.
- Maximum stone size of 50 mm.

### Insecticide

Use Chlorpyrifos for termite control. Insecticide shall be used strictly in accordance with the manufacturer’s instructions.

### Mulch

**ORGANIC**
- Shall be stable, free from impurity, and be sufficiently heavy to prevent dispersal by wind.
- Shall be shredded bark, wood chips, hay or similar.
- Wood chips shall be a maximum size of 50 mm, inert, and shall be free of resinous toxins and termites.

**INORGANIC**
- Shall be washed and screened lateritic gravel or brick chips with particle sizes in the range 6 mm minimum to 25 mm maximum.

### SITE PREPARATION

#### Setting Out

The Contractor shall be responsible for accurately setting out the works in accordance with the drawings.

In particular, trees shall not be planted:
- within 30 m of the end of a central median for trees, or 10 m for shrubs;
- within 5 m of a road light pole;
- within 1.5 m of a fire hydrant; or
- where their location will ultimately obscure traffic signs, signals, or other essential roadside features.

#### Protection of Existing Vegetation

Ensure all trees, shrubs, and other vegetation to be retained within the limits of work are not damaged, and the conditions hereunder are conformed to.

Protect vegetation prior to commencing construction work in the vicinity of that vegetation.

Do not place or dump any chemical type materials including oil, paint, bituminous products, fuels, and cement/concrete near the vegetation - even for short periods. Prevent windblown chemical type materials, such as cement, from affecting vegetation.

Do not stockpile bulk materials - such as spoil from excavation, boulders, cleared vegetation - under or near vegetation. Ensure such spoil is never placed against trunks, even for short periods.

Do not remove topsoil from within the dripline (i.e. canopy area) of vegetation unless essential to the works. For any excavation within the dripline keep open as short a period as possible, and use excavation methods that preserve the root system intact and undamaged.

Cut roots only where it is absolutely necessary. When cutting roots use a means which does not disturb the remaining root system.

Backfill excavation around tree roots with material of at least comparable quality to that excavated. Consolidate backfill and do not backfill around trunks above the original level. Thoroughly water backfilling.

Avoid damage to overhead limbs by machinery. Only remove the minimum amount required if limbs must be removed to allow machinery to work.

Where branches are to be removed, cut them back to the branch collar.

Compensation for damage to existing vegetation shall be borne by the Contractor and determined as follows:

**Trees (including palms and cycads)**
- Valuation rate of $10 per centimetre of trunk circumference at a height of 1 metre above the ground level, within the following limits:
  - Minimum valuation: $250 per tree.
  - Maximum valuation: $2,500 per tree.

**Shrubs**
- Valuation rate of $8 per centimetre of trunk circumference at a height of 1 metre above the ground level.

#### Earthworks

Remove from site all unwanted vegetation. Backfill and regrade over areas where trees have been removed.

Regrade all areas of excavation to ensure all finished surface levels are free draining.

Excavate or fill to lines and levels shown on the drawings.

Fill placed on areas to be landscaped shall be free from inorganic, deleterious material and stones greater than 100 mm nominal size.

Compact fill sufficiently to ensure initial settlement and provide a firm base.
Clear all subgrade surfaces of stones exceeding 100 mm diameter and rubbish, weeds and roots.
No excavation shall be allowed within 1.5 m of the canopy area of an existing tree.

16.4.4 Topsoil
Excavate and stockpile material which is suitable for reuse as topsoil.
Imported topsoil shall be as specified in IMPORTED SOILS.
Stockpile topsoil in a free draining area in stockpiles not exceeding 2.0 m in height.
Ensure stockpiles are properly maintained.

16.5 PLANTING

16.5.1 Setting Out of Holes – Hold Point
Accurately set out the locations for trees/shrubs to be planted in accordance with the drawings.
Hold point - Obtain approval of the set out from the Superintendent before commencing any planting.

16.5.2 Preparation and Treatment of Holes
Identify all cable and services locations prior to excavating any holes.
Prepare holes initially in accordance with the table INITIAL HOLE PREPARATION CHART.
Remove excess excavated material, rubbish and cut vegetation from site.
Excavate planting holes by mechanical/manual means.
Size of planting holes shall be twice the diameter and twice the depth of the plant container, unless shown otherwise on the drawings.
Break up glazed sides of holes.
Treat planting holes in hard, dense material prior to planting by
- placing 1 kg Gypsum or Claybreaker around the sides and bottom of the hole; and
- filling hole with water and allowing to drain.
Treat holes with Chlorpyrifos in accordance with manufacturer's instructions prior to planting.

Table - Initial Hole Preparation Chart
Refer to Clause 15.9 for Tables

16.5.3 Supply of Plants
Place an order with an approved nursery for the supply of all plants required to complete the works within seven days of acceptance of tender.
Ensure that a minimum of five or 5%, whichever is the greater number, additional plants of each species nominated is available if necessary for replacement purposes.
Remove immediately from the site all dead, dying or diseased plants and replace with new plants of the same species.

16.5.4 Treatment of Plants
Do not use chemicals on site.
Containerised plantings shall be well watered prior to despatch from the nursery and shall remain in the containers until required for planting.
Protect all plants during transportation, against excessive sunlight, wind and drought.
Trees and shrubs which are not immediately planted shall be stood upright on level ground, protected and maintained in good condition by the Contractor.
Replace immediately all plantings which have become damaged, missing or fallen below the specified standard.
Check regularly for any termite/insect attack or fungal infestation. Carry out eradication by use of sprayed insecticide or fungicide in accordance with the manufacturer's instruction.

16.5.5 Planting of Trees, Shrubs and Ground Cover
Planting shall take place only in conditions where temperature range is below 32 °C.
Maintain the integrity of the plant root zone and the surrounding earth mould.
Place fertiliser in the hole adjacent to, but not in contact with, the root zone of the plant. Fertiliser shall be in accordance with the table FERTILISERS. Application rates in accordance with the table FERTILISER APPLICATION RATES.

Table - Fertiliser Application Rates
Refer to Clause 15.9 for Tables

16.5.6 Backfilling
Backfill material shall be in accordance with the table INITIAL HOLE PREPARATION CHART.
Backfill the hole so that the plant is contained firmly in the ground in a vertical position.
Backfill the hole to finish surface level and dish to retain water.
Work surface fertiliser into top 50 mm of backfill. Fertiliser shall be in accordance with table FERTILISERS. Application rates in
accordance with the table FERTILISER APPLICATION RATES.

Water backfill material immediately after surface fertilisation to ensure no air voids or loose material surround the plant root zone.

16.5.7 Watering and Maintenance
Maintain each planting area in a moist condition to promote healthy growth.
Weed and prune as required to maintain plants in a healthy condition.

16.5.8 Mulching
Supply mulch as specified that is free from weeds, seeds, sticks, stones, insects, diseases and other deleterious matter.
Provide, where specified, organic mulch in a 100 mm thick compacted layer for a 500 mm radius from the main stem.
Ensure a gap of 50 mm is retained between the main stem and the mulch.

16.6 GRASSING

16.6.1 Ground Preparation
Bring the area to a fine tilth. Conform to the prescribed finished levels prior to the placement of grass seed.
Remove all stones over 50 mm diameter, debris and deleterious material.
Backfill with topsoil all voids created by the removal of obstructions and deleterious material.
Provide loose depth of topsoil to achieve a minimum topsoil thickness of 100 mm after natural settlement.
Compact the topsoil lightly to minimise subsidence.
Placement and spreading of topsoil shall not take place during periods of heavy rain.
Protect the area to prevent further compacting and trafficking once topsoiling is complete.
Take preventative measures to control erosion and siltation and restore/replace any portion which erodes, silts up or is otherwise damaged.
Apply fertiliser as specified in the table FERTILISERS, at an application rate shown in the table FERTILISER APPLICATION RATES, as a minimum, to the finished topsoiled surface and lightly work into the soil. The fertiliser may be applied simultaneously with the grass seed.

16.6.2 Supply
Supply fresh seeds of the species nominated in GRASS.

16.6.3 Application
Refer to the table FERTILISER APPLICATION RATES.
Apply seed uniformly by mechanical means. Hand distribution shall only be in areas inaccessible to machinery.

16.6.4 Reseeding
Reseed areas that fail to germinate and propagate after 28 days.
Bring areas requiring reseeding to a fine tilth by hand raking only.
Grass seed application to be in accordance with the table SEED MIXES.

16.6.5 Irrigation
Water seeded areas as often as is required to keep the ground moist.

16.6.6 Establishment
Maintain grassed area free of all weeds and insects.
Ensure grass has and maintains complete uniform coverage with active growth.

16.6.7 Mowing
Mow the grass as follows:
- First cut when height reaches 150 mm.
- Further cuts to maintain grass height in range 50 - 100 mm.

16.7 IRRIGATION

16.7.1 Irrigation System
General
Standard: To AS/NZS 3500.1
Place a high priority on avoiding surface runoff when selecting system components. Use low trajectory sprinklers where possible. Select components to keep the sprinkler precipitation rate below the infiltration rate of the soil and/or use repeat cycles to allow water to soak into the rootzones.
Where possible, separate station/zones for irrigation at the top and bottom of sloped areas.

Materials
Pipework upstream of control valves: Use uPVC class 12.
Pipework downstream of control valves: Use uPVC class 9 or high density polyethylene.

Performance
Coverage (mm of water over area to be watered): 50 mm per week during the establishment period and then progressively hardening off the local conditions. Ensure that final water usage is such that plant health and vigour is maintained without wastage of water.
Table – Irrigation Schedule

Irrigation Schedule: Fittings and attachments include but are not limited to those scheduled below for specific locations or fixtures:

<table>
<thead>
<tr>
<th>Location</th>
<th>Item</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>At points shown on drawings</td>
<td>External hose cocks</td>

<td>Bubblers</td>
<td>Type Adjustable from 0 - 10 litres per minute.</td>
</tr>
</tbody>
</table>

Backflow

Fit a backflow prevention device; To AS/NZS 3500.1 and as required to meet the approval of PowerWater.

Pressure regulating valves

Provide a pressure regulating valve at the take-off point which is adjustable between 100 and 700 kPa. Install an 800 mm filter sized to suit the flow immediately upstream from the pressure regulating valve, and provide gate valves upstream from the filter and downstream from the pressure regulating valve. Mount the assembly in an accessible position in a valve box or access pit as required.

Irrigation Controller

Use electric solenoid valves wired to an irrigation controller.

In the Darwin Region, the irrigation controller is to be compatible with a “Toro Irrinet” irrigation telemetry system. At the completion of the defects liability period, liaise with the Departments landscape maintenance contractor to have the irrigation system handed over and included into the telemetry control system.

Mount the controller in a weatherproof lockable cabinet. Include the following features:

- Variable timer for each station with a range from 1 minute to not less than 30 minutes.
- Manual cycle and individual station operation.
- Manual on-off operation of irrigation without loss of program.
- 240 V input and 24 V output capable of operating 2 control valves simultaneously.
- 24 hour battery program backup.

Power surge protection.

Electrical connection: Connect to a 240 V supply and provide an isolating switch at the controller.

Automatic control valves: 24 V solenoid actuated hydraulic valves with flow control and a maximum operating pressure rating of at least 1 MPa. Provide valves able to be serviced without removal from the line. Install a gate valve of the same size immediately upstream from each automatic control valve. House both valves in a valve box with high impact plastic cover at finished ground level.

Control wires: Connect the automatic valves to the controller with building wire laid in sealed conduits, with the mainline where possible. Lay intertwined for their full length without joints except within valve boxes. Use waterproof connection. Provide expansion loops at each solenoid lead or joint. Backfill trenches only after inspection and approval of wiring. Minimum size active 1.5 mm². Minimum size common 2.5 mm² laid in closed loop.

Sprinkler Heads

Provide heads which maintain a preset arc of throw, adjustable for radius, during watering operations and which are vandal-resistant.

Pop-up type heads: Heads designed to rise out of their housings under supply pressure to a minimum “pop-up” height of 50 mm.

Risers

Mount all in-ground heads on reticulated risers. Mount above ground on fixed risers.
Micro irrigation system
Polyethylene irrigation pipe: To AS 2698.1 Class IRRIG with barbed fittings of similar pressure rating fastened with ratchet type clamps. Lay pipe on finished ground surface under planting bed mulch and anchor at minimum 1.5 m intervals with U-shaped stakes. Connect micro-tube laterals with proprietary push in or screw in fittings.
Microsprays: Mount microsprays on stakes 300 mm above ground and connect to the pipework with microtubes.
Drippers: Use drippers which are turbulent flow types, easily dismantled for cleaning. Connect directly into the pipework or with microtubes.
Micro irrigation valve box: Use micro irrigation valve boxes which are of high impact plastic with snap lock covers at finished ground level, each housing a stop cock, filter (200 mm for microsprays, 100 mm for drippers), pressure reducing valve (170 kPa outlet pressure) and automatic control valve.

16.7.2 Design plans – Hold Point
Hold Point - Submit drawings to Superintendent for approval indicating design proposals showing all pipework, sprinklers, valves and control systems.

16.7.3 Setting Out
Mark out the positions of the irrigation lines prior to excavation and:
- ensure completed surface levels are in accordance with the design plans; and
- obtain the location of existing services from the relevant authorities and identify on the ground prior to excavation.

16.7.4 Excavation
Excavate in accordance with AS/NZS 3500.1
Excavate to the lines, levels and grades as required for irrigation trenches. Trench depths and widths as required by AS 3500.1
Liaise with relevant authorities to locate existing services.
Excavate within one metre from existing underground services by hand only.
Damage to existing services and vegetation to be rectified at Contractor's expense.
The Contractor shall be deemed to have allowed for the cost of performing the required excavations in whatever material may be encountered, and no extra payment shall be paid for excavation in rock.
Cut back roots encountered in trenches to not less than 600 mm clear of the pipework.
Remove such other obstructions including stumps, boulders and the like which may, in the opinion of the Superintendent, interfere with the pipework.

At road crossings, provide under road boring at right angles to the road centre line, by an approved specialist subcontractor. Place all pipeline beneath roadways in heavy duty conduit casing. Refer to THRUST BORING section.
Stockpile topsoil on site.

16.7.5 Installation
Install pipework in straight lines and uniform grades. Keep the number of joints to a minimum.
Install conduits and pipes having grade or class identification marking so that the marking is visible for inspection.
Lay all pipework under paths, paving or slabs in conduits.
Install according to irrigation design specifications.
Obtain approval from PowerWater - Water Directorate before connecting to water supply system.
Install all pressurised pipework, fittings and other fixtures to existing water supply system as well as Class 12 UPVC and above pipework by a qualified plumber licensed in the Northern Territory.
Provide 50 mm thick compacted bedding of clean granular sand free from stones and other debris over the total width of all excavations.
Clean all surfaces of UPVC joints with an approved cleaning fluid prior to jointing.
Solvent weld all UPVC joints, unless otherwise specified.
Flush all pipework prior to the attachment of sprinklers, drip emitters and the capping of pipeline ends.
Install and connect all fixtures shown on the design plans in a neat, waterproof manner and in accordance with the manufacturer's instructions and the Standard Drawings as issued in the NT Plumbing Code.
Install all 240 volt electrical work by a qualified electrician licensed in the Northern Territory. All wiring and jointing shall use PowerWater approved materials. Join 240 V electrical wiring with a waterproof jointing kit.
Place all solenoid valve wiring beside the appropriate pipework in the conduit. Size conduit to allow free movement of wiring and draw wire.
Run all electrical wire in continuous lengths between the controller and valve. Ensure the wire is not kinked.

Ensure adequate length of wire is available at valves during installation to enable future replacement of valves.

**16.7.6 Water Source**

Liaise with PowerWater as DoI’s service liaison consultant in relation to water supply requirements associated with this contract.

Carry out the excavation necessary to locate and expose the connection point. On completion, reinstate surfaces and elements which have been disturbed such as kerbs, footpaths and nature strips.

Obtain approval from PowerWater before connecting to the water supply system.

**16.7.7 Testing – Hold Point**

Check pipe joints, valve seats, tap washers, strainers and other elements for leaks. Repair or replace if damaged, and retest.

Provide all equipment necessary for testing.

All joints and connections are to remain visible during the test.

Measure pressure at the lowest section of pipework being tested.

Pressure minimum of 800 Kpa shall be maintained for a minimum period of two hours in all pressure pipework and fittings up to and including the solenoid valves, except in spray, drip, and micro sprinklers.

Repair and retest all leaks prior to acceptance.

**Hold point** - Obtain Superintendent's approval to proceed with backfilling other than spot filling to retain pipework from movement during pressure testing.

**16.7.8 Backfilling**

Generally: Backfill trenches as soon as possible after approval of laid and bedded service.

Provide clean granular sand cover around the pipe and to a compacted thickness of 100 mm above the pipe.

Compact the sand with a vibrating plate or similar.

Place and compact select fill conforming to the PAVEMENTS AND SHOULDERS Section to 100 mm below existing surface. Compact to density of surrounding material.

Place 100 mm of topsoil over select fill and treat similar to existing surface.

Remove all surplus material from site.

Ensure the surface of all backfilling does not pond water.

Remedy any surface settlement due to backfilling during the maintenance period.

**16.7.9 Telemetric Control Station Details**

Telemetric operated Irrigation control stations shall be constructed to comply with the following requirements. Refer to the attached drawing number R09-3124.

**MATERIALS:**

**Mounting post**
- 3600 mm (length) x 75 mm square hollow section (SHS) of 3 mm gauge steel, sealed at both ends with welded steel plates.
- It shall have two horizontal metal brackets, 300 mm x 60 mm x 3 mm gauge, welded to it in the positions specified on the design drawings for mounting a control box. When constructed it shall be hot dip galvanized.

**Lockable stainless steel control cabinet**
- 600 mm (height) x 400 mm (width) x 200 mm (depth)
- The lock shall be incorporated into the design and the box shall be of sturdy ‘vandal-proof’ construction.

**Stainless steel whip aerial**
- RF Industries model CD 28-41-70.

**Irrigation controller**
- Must be compatible with Motorola IRRInet Radio
  - Motorola Model GP328
  - Frequency - one of either of the following frequencies, depending on the location of the irrigation system within the Greater Darwin area (details of which can be obtained from the Superintendent).
    - Area A – 150.825mhz
    - Area B – 155.425mhz

**Solar panel**
- Must have sufficient capacity to maintain the charge in the batteries of the control station equipment

**INSTALLATION:**
- Position the control station in the location specified in the design drawings.
- Position the post 600 mm into a concrete footing. The footing shall have minimum dimensions of 350 mm diameter x 650 mm deep. The post must be vertical.
- Affix the control box securely to the mounting brackets
  - The base of the box shall be 1350 mm above the ground.
- Use 4 x 316 stainless steel bolts with round heads to prevent theft.
- Bolt head must be on the outside of the box with the nuts inside.
- Control equipment will be affixed securely to the inside of the box and arranged neatly for ease of operation.
- Cabling:
  - Cabling shall be run internally through the mounting post.
  - Flexible conduit shall be inserted in the entry and exit points to prevent chafing.
  - Conduits will be joined with a weatherproof seal.
  - Conduit shall be used between the post and the control box to provide weatherproofing.
- Aerial shall be mounted vertically on top of the post.
- Solar panel:
  - Mount on top of the post.
  - Mount at an angle of 11 degrees to the horizontal with the cells facing north.

16.7.10 As Constructed Drawings
All changes and variations to the design shall be recorded during construction, particularly items that are covered or become inaccessible.

Provide hardcopies of the amended information and drawings progressively as the work proceeds, with or before the variation which led to the need to amend the information and drawings to accurately reflect the as built condition.

Provide As Constructed drawings of the irrigation system in electronic CAD format (AutoCad or Microstation) to the Superintendent within two weeks of practical completion. Drawings are to show as installed locations of all pipework, fittings, sprinklers, control valves, controllers, wiring, accessories etc.

16.8 ESTABLISHMENT PERIOD

- Keep the site neat and tidy at all times.
- Ensure the irrigation system is maintained and performs in accordance with the design plans. The operating schedule is to be adjusted to suit wet/dry season conditions. Prevent excessive watering.
- Keep the root ball of all plants moist at all times.
- Keep all plants and grass in a healthy actively growing state.
- Keep the whole site weed free.
- Repair eroded areas and re-establish to maintain the design.
- Replace all damaged, dying or dead plants within 10 working days.
- Maintain all plantings free from insects, pests and diseases.
- Fertilise all plantings and grass in accordance with the tables FERTILISERS and FERTILISER APPLICATION RATES, ensuring to work any fertilizer into the soil around the base and dripline of the plant to prevent runoff.
- Ensure mulch is maintained at the specified levels.
- Ensure all stakes and ties remain secured with adjust ties to suit plant growth. Replace broken stakes and ties immediately.
- Prune trees and shrubs as required, or as directed by the Superintendent, to encourage dense bushy growth; use only qualified personnel.
- Prune established trees for a 3 m clearance where high profile machinery will be required to use the area regularly.
- Remove all branches sweeping the ground.
- Remove all pruning within 2 m of the ground to within 10 mm of the main stem.
- Keep ground cover plants free of dead vegetation.
- Mow grass when grass height exceeds 100 mm and in accordance with the clause titled Mowing.
- Remove grass cuttings from site.
- Trim neatly all edges of grassed areas at the same time as mowing.
- Keep all stormwater drains clean of debris and silt to allow unrestricted flow of stormwater run-off.
- Remove termite mounds and treat the specific site with Chlorpyrifos.
- Use all insecticides and fungicides for the control of termites/insects and other infestations in accordance with the manufacturer’s instruction.

16.8.1 Establishment Period Records
- Maintain accurate current records of all maintenance work during the establishment period, including; the number of employees on site and the work conducted.
- Unscheduled audits may be conducted by the Superintendent throughout the 13 week period.

Records shall be presented upon request.

</table>
17 DUCTING AND CONDUITS

17.1 STANDARDS
Conform to the following Standards and Publication unless specified otherwise, and with the requirements of the PowerWater Corporation, and Telstra Australia:

AS 1345 Identification of the contents of pipes, conduits and ducts.
AS/NZS 2053 Conduits and fittings for electrical installations.
AS/NZS 3500 Plumbing and drainage

17.2 SUPPLY AND INSTALLATION
In kerbed areas terminate duct crossings 500 mm behind kerbs unless specified otherwise.
In areas of no kerbing, terminate duct crossings clear of the pavement as specified.
Excavate trench to a width appropriate for the ducting and which allows compaction of the backfill to be readily undertaken.
Provide the specified minimum cover required by the relevant authority but not less than 750 mm.
Locate ducts to avoid other services.
Lay at right angles to the road centre line and with straight lines and grades unless specified otherwise.
Minimum fall to be 1% to the lower side of the road.
Lay ducting on 50 mm thick sand bedding.
Install 4 mm galvanised draw wires in all conduits. One draw wire to remain in place in conduit.
Cap all conduits with standard UPVC caps.
Place marker tape from each end of the conduit to the surface.
Backfill the trench with select fill to subgrade level and compact to 95% relative compaction.
Where trench excavated through pavement, backfill above subgrade level with base gravel, as specified in the PAVEMENTS AND SHOULDERS Section, compacted to 100% relative compaction. Reinstate the surface.

17.3 MARKINGS
In kerbed areas, mark kerbs with a letter to identify the type of ducts which pass under them as follows:

Electrical: ‘E’.
Telstra: ‘T’.
Water: ‘W’.
Height of letter: 50 mm.
Width of letter: 30 mm.

Stamp the letter into new kerb after the concrete has taken its initial set and before final set.
In existing kerbed areas, mark existing kerb with an aluminium plate containing the identification letters as specified.
Place a star picket 1300 mm long, painted white and set 300 mm into the ground directly over each end of the conduit.
Attach an identification letter in red paint on a 50 mm x 30 mm aluminium plate fastened securely to the picket.

17.4 CONDUIT MARKERS
Erect 600 mm x 600 mm signs at locations specified to highlight the existence of conduits. Sign legend to be:
"Service Conduits Laid. Opening of Road Surface Prohibited."

17.5 ELECTRICAL DUCTING (‘E’)
Ducting conduit shall be heavy duty uPVC coloured light orange and solvent cement jointed.
Lay a copper earth strap (3 mm x 25 mm) in a continuous strip along the bottom of each trench.
Supply and install orange PVC cable marker tape over the ducts as specified.
Liaise with Power and Water Authority regarding the installation of the ducts.

17.6 WATER DUCTING (‘W’)
Ducting conduit to be heavy duty PVC, 100 mm diameter, coloured white and solvent cement jointed.
Lay conduits two to a trench opposite each alternate lot boundary.
Service each lot by a separate conduit.
Liaise with Power and Water Authority regarding the installation of the ducts.

17.7 TELSTRA DUCTING (‘T’)
Telstra Australia will excavate for, supply, install and backfill over all Telstra ducting.
Liaise with Telstra and give minimum 14 days notice prior to the need for ducting to be installed.
The locations of Telstra ducts are shown on the drawings or will be indicated by Telstra personnel.
18 TRAFFIC CONTROL SIGNALS

18.1 STANDARDS

Conform to the following Standards and Publication unless specified otherwise:

Cited standards:

- AS/NZS 2276 Cables for traffic signal installations
- AS/NZS 2276.1 - Multicore power cables
- AS/NZS 2276.2 - Feeder cable for vehicle detectors
- AS/NZS 2276.3 - Loop cables for vehicle detectors
- AS 2353 Pedestrian push button assemblies
- BS 381C-637 Medium sea grey
- CS 1501 Standard drawing signal details pole foundation
- CS 1502 Standard drawing signal details mast arm foundation
- CS 1503 Standard drawing signal details controller foundation

Other relevant standards:

- AS 1163 Structural steel hollow sections
- AS 1231 Aluminium and aluminium alloys - Anodized coatings for architectural applications
- AS/NZS 1477 PVC pipes and fittings for pressure applications
- AS/NZS 1554 Structural steel welding Set
- AS/NZS 1594 Hot rolled steel flat products
- AS 1742 Manual of uniform traffic control devices Set
- AS 1743 Road signs – Specifications
- AS/NZS 2053 Conduits and fittings for electrical installations Set
- AS/NZS 2144 Traffic signal lanterns
- AS 2339 Traffic signal posts and attachments
- AS 2700 Colour standards for general purposes (Set)
- AS 2703 Vehicle loop detector sensors
- AS 2979 Traffic signal mast arms
- AS/NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules)
- AS/NZS 3100 Approval and test specification - General requirements for electrical equipment
- AS/NZS 3191 Electric flexible cords
- AS/NZS 3678 Structural steel - Hot-rolled plates, floorplates and slabs
- AS/NZS 3679.1 Structural steel - Hot rolled bars and sections
- AS/NZS 4680 Hot dip galvanized (zinc) coatings on fabricated ferrous articles
- AS/NZS 5000.1 Electrical cables – Polymeric insulated – For working voltage up to and including 0.6/1 (1.2)kV
- AS/NZS 61558 Safety of power transformers, power supplies, reactors and similar products – General requirements and test Set

18.2 CONCRETE

Refer to the MISCELLANEOUS CONCRETE WORKS Section of this Specification for concrete footings and the reinstatement of concrete footways.

18.3 GENERAL EQUIPMENT AND INSTALLATION

18.3.1 Safety

Provide for the safety of vehicle and pedestrian traffic as specified in the PROVISION FOR TRAFFIC Section.

Enforce safety precautions with regard to power cables.

18.3.2 Lightning Strikes and Power Surges

Supply and install a 25A surge reduction filter. Connect in a series configuration with the primary 240 V AC power supply prior to the main circuit breaker, as recommended by manufacturer.

18.3.3 Pedestals and Supports

Use galvanized posts and fittings. Provide posts in one continuous length without joints.

All welds to be continuous and carried out prior to galvanizing.

Construct footings as specified. Refer to standard drawings CS 1501 and CS 1502.

Reinstate footways once footing concrete has cured and pedestals and/or mast arms are installed.

Provide 450 x 450 x 50 lean mix concrete support collar around pedestals. Box out where pedestals are in concrete islands or footways.

18.3.4 Vehicle Signal Lanterns

Position lantern assemblies (including cowls, louvres and target boards) so that:

- no part is within 300 mm of the line of the kerb face;
- the top of the assembly is 4.0 metres above the pavement level;
- any arrow aspects are located to the left or right side (as appropriate) of the associated round aspects; and
- they are as specified.
Provide a rectangular target board for all lantern assemblies.
Blank out the unused aspect positions of target boards with a material of similar colour and finish to the target board.
Signal lantern doors to be capable of opening through 90 degrees without having to alter the adjustment of any signal lantern.
Signal Lanterns to be NT Standard LED Type by Aldridge Traffic Systems Pty. Ltd., or a similar product approved by Superintendent before installation.
Maintain the vehicle signal lanterns with a cover of suitable heavy duty material immediately after erection of the signal lantern and prior to commissioning.
Attach the temporary covers neatly so that they remain in place during all weather conditions.
Provide an inspection hole in the cover, to allow for testing of lantern wiring with covers in place.

**18.3.5 Pedestrian Signal Lanterns**
Use lanterns with 200 mm diameter lens.
Use symbolic displays.
Position lantern so that
- no part is within 300 mm of the line of the kerb face;
- centre of green lens is 2.2 m above the footway; and
- the signal is clearly visible from the opposite side of the carriageway.
Signal lantern doors to be capable of opening through 90 degrees without having to alter the adjustment of any signal lantern.
Pedestrian Signal Lanterns to be NT Standard LED Type by Aldridge Traffic Systems Pty. Ltd., or a similar product approved by Superintendent before installation.

**18.3.6 Traffic Signal Controller**
Locate the controller as specified.
Mount the controller on a concrete foundation block as specified. Refer to standard drawing CS 1503.
Arrange and connect power to the controller, and supply and provide additional plant, equipment or work required by the PowerWater Corporation.
Transport and install the controller in accordance with the manufacturer's specifications.
Supply and install an earth stake.
Test and commission the completed installation.

**18.3.7 Painting**
Finish colours for:
- lantern assemblies including backing plates to be matt black; and
- terminal assembly finial caps and controller housing to be medium sea grey (BS 381C-637; Hex #899194; CMYK 7:2:0:42).

**18.4 TRAFFIC SIGNAL CABLELING**

**18.4.1 Multicore Connecting Cable**
Cable used shall be 51 core multicore as per AS/NZS 2276.1 and shall have a polyamide jacket termite sheath installed
Terminate the cabling of signal lanterns and multicore cable in each associated terminal assembly.

**18.4.2 Loop Detector Feeder Cables**
Cable used shall be as per AS/NZS 2276.2 and shall have a polyamide jacket termite sheath installed.
Install and connect feeder cables from detector loops to detector sensors units located in the controller housing.
Feeder cables to be Telcon - type B3102 CS/NJ/PVC or equivalent.
Feeder cables to be indelibly marked with the loop detector number at each end.

**18.4.3 Loop Cable for Vehicle Detectors**
Cable used shall be as per AS/NZS 2276.3 Cable will be V90 HT, 30/0.25.
Supply and install the cable for the loop in a saw cut in the pavement surface.
Clean the saw cut of debris and sharp edges before installing the cable.
Twist loop feeder cable one turn every 200 mm between each loop and junction in the detector pit.
Backfill around the loop cables with emulsion filler. Use Pabkote Emulsion No. 3 or similar.
House cables in conduits where they pass under kerbs. Refer to standard drawing CS 1507.

**18.4.4 Power Supply Cable**
Supply and Install 2x 1C 25 Sq mm Cu XLP/Nj/PVC cable or PowerWater approved equivalent.
PowerWater to approve cable type and connection details
Provide connection of the PowerWater cable to controller.
Provide Notice of Intent to PowerWater for un-metered connection

**18.4.5 Cable Conduit**
Terminate the ends of conduits at pits 25 mm - 75 mm inside the pit.
Provide a draw wire in each conduit at completing of wiring.
Provide a residual length of at least one metre of draw wire in junction pits.

Install conduits in accordance with the DUCTING AND CONDUITS Section, with the exception that the copper earth strap to be deleted.

18.4.6 Conduit Junction Pit

Provide conduit junction pits and covers to house conduit ends, and 1.5 metres of residual cable for each cable in the pit.

Place conduit junction pits on 100 mm thick coarse gravel bed.

Conduits shall have minimum 100 mm clearance from coarse gravel bed.

Drill neat holes for the entry of cable conduits not greater than 10 mm larger than the outside diameter of the conduit.

Install pits so that lids are level with the adjacent finished surface and backfill in accordance with the DUCTING AND CONDUITS Section.

18.4.7 Detector Pits

Provide detector pits to house joints in loop detector feeder cable.

Pits to be HR Products Model No. 1420 or similar.

Bed the pits on 75 mm thickness of compacted sand.

Backfill in accordance with the DUCTING AND CONDUITS Section.

18.4.8 Inspections – Witness Point

Witness point - Give 24 hours notice to the Superintendent for inspection of excavations for pedestals, bases and conduits.

18.5 PEDESTRIAN PUSH BUTTON ASSEMBLIES

Pedestrian push button assemblies to be NT Standard LED Type by Aldridge Traffic Systems Pty. Ltd., or a similar product with prior approval by Superintendent. Refer to standard drawing CS 1505 and CS 1506.

Install pedestrian push buttons onto pedestal and mast arms as specified.

18.6 AUDIO-TACTILE TRAFFIC SIGNAL EQUIPMENT

18.6.1 General

Provide equipment additional to the provisions of AS 2353 to generate audio and tactile signals at stations.

Audio-tactile driver to be NT Standard LED Type by Aldridge Traffic Systems Pty. Ltd., or a similar product with prior approval by Superintendent.

18.7 SCATS FACILITIES – HOLD POINT

18.7.1 Communications Isolation Pillar

Supply and install pillar including foundation and mounting facilities as specified. Refer to standard drawing CS 1504.

18.7.2 Connections Between Controller and Communications Isolation Pillar

Supply and install Class 12 white PVC conduit with 300 mm radius bends and draw wire.

Supply and install Telcon type P3102 CS/NJ/PVC cable or equivalent.

Complete all connections between intersection controller and communications isolation pillar.

18.7.3 Connection to Telstra Pit from Communications Isolation Pillar – Hold Point

Supply and install Class 12 white PVC conduit with 300 mm radius bends and draw wires.

Hold Point - Connection into Telstra point of entry shall be undertaken under Telstra supervision and as per Telstra requirements.

Provision and connection of Telstra cable from Telstra pit to the isolation pillar is the responsibility of Telstra.

18.8 DOCUMENTS AND PLANS – HOLD POINT

Hold Point - Submit to the Superintendent one complete set of CAAD as Constructed Drawings and completed Cable Layout and Connection Chart before the issue of the Certificate of Practical Completion.

18.9 CHECKING AND TESTING – WITNESS POINT

Witness Point - Give 24 hours notice to the Superintendent for inspection of excavations for pedestals, bases and conduits.

Witness Point - Give 24 hours notice for checking and testing signal controller, cabling and lanterns.
19 TRAFFIC COUNTING STATIONS

19.1 STANDARDS
Conform to the following Standards and Publication unless specified otherwise:

Cited standards:
- CS 1550 Standard traffic counting station post mounted detector loop and pit details
- CS 1501 Standard drawing signal details pole foundation
- CS 1502 Standard drawing signal details mast arm foundation
- CS 1503 Standard drawing signal details controller foundation
- CS 1554 Standard traffic counting station post mounted cabinet wiring diagram
- CS 1555 Standard traffic counting station post mounted post assembly

Other relevant standards:
- AS 1012 Methods of testing concrete.
- AS 1160 Bitumen emulsions for the construction and maintenance of pavements.
- AS /NZS 1252 High strength steel bolts with associated nuts and washers for structural engineering.
- AS 1397 Steel sheet and strip - Hot dipped zinc coated or aluminium/zinc coated.
- AS /NZS 2053 Conduits and fittings for electrical installations.
- AS 2276 Cables for traffic signal installations.
- AS 2700 Colour standards for general purposes.
- AS 2703 Vehicle loop detector sensors.
- AS /NZS 3000 Electrical installations (known as the Australian/New Zealand Wiring Rules).
- AS 3147 Approval and test specification - Electric cables - Thermoplastic insulated for working voltages up to and including 0.6/1 kV.
- AS /NZS 3191 Approval and test specification - Electric flexible cords.
- AS 3600 Concrete structures.
- AS/NZS 4671 Steel reinforcing materials
- NTTM NT Test Methods

19.2 CABINETS
Cabinets will be provided by the Principal. Install as specified. Refer to standard drawing CS 1554.

Cabinets to open away from and aligned square to the road.

19.2.1 Terminal Blocks
Provide two terminal blocks for the termination of loop detector feeder cables similar to Clipsal 543.
Mount the terminal blocks on the front edge of the cabinet lower shelf.
Supply two copies of drawing showing labelled loop layout and terminal blocks.

19.2.2 Switchboard for Solar Power Site
Provide and connect a 10 amp on-off switch with the up position as off and clear marks for on and off.
Provide a four terminal strip similar to Clipsal 543.
Mount and connect voltage regulator as specified. Refer to standard drawing CS 1554.
Clearly label terminal strip ‘+’ and ‘-’.
Wire solar panel to terminal strip via switch and regulator.
Mount the switch regulator and terminal strip on a non-hygroscopic, non-inflammable base 6 mm Bramite or similar.
Separate the switch and strip a minimum of 100 mm.

19.3 CABLING
Provide detector loop cable of 30/025 V105 type or similar.
Twist loop feeder cable one turn every 20 cm between each loop and junction in the detector pit.
Provide loop detector feeder cable of Telcon B3102 CS/NJ/PVC type or similar.
Provide Piezo detector feeder cable of 75 ohm co-axial cable type RG59.
Provide solar power feed cable of 30/025 V105 type or similar, red and black.
Join cables by soldering.
Insulate and seal against ingress of water by using mastic filled heatshrink Sigmaform SST 12-04 or similar.
Ensure heatshrink covers at least 25 mm of insulation beyond the join.

19.4 CONDUIT
Provide and lay 50 mm HD PVC conduit and one P20 white PVC conduit as specified.
Allow 25 mm clearance between adjacent conduits.
Provide sand cover minimum 100 mm above conduit.
Provide electrical marker tape 150 mm below natural surface in conduit trenches.
Terminate the conduits 25 mm inside detector pit, and 100 mm above natural surface within pole assembly as specified. Refer to standard drawing CS 1550 and CS 1553.

Ensure minimum cover of 450 mm over conduits.

19.5 POLE ASSEMBLY
The pole assembly including solar panel will be provided by the Principal.
Provide opening in solar panel backing plate to allow passage of wires inside the post as specified. Refer to standard drawing CS 1555.

19.6 INSTALLATION - GENERAL
Installation shall include the following civil works:
- Excavation.
- Backfilling.
- Reinstatement.
- Thrust boring.

Provide for the safety of traffic in accordance with the PROVISION FOR TRAFFIC Section.

19.6.1 Excavation
Excavate roadways to a maximum of 100 mm wide.
Saw cut excavations through paved footways.
Cut excavation vertically.
Provide bridging of excavations to maintain vehicular access at all times.

19.6.2 Backfilling
Backfill all excavations.
Remove all rubbish and foreign material from the excavation prior to backfilling.
Backfill with select fill and compact to 95% relative compaction, in accordance with the EARTHWORKS Section.

19.6.3 Concrete Foundation for Pole Assembly
Compact the bottom of excavation prior to pouring foundation.
Align rag bolts to ensure cabinet is square to the road.
Use Class N20 concrete for the foundation.
Reinstate by compacting surrounding soil to match existing.

19.6.4 Detector Pits
Provide pits for detector terminations as specified. Refer to standard drawing CS 1551 and CS 1550.

19.7 INSTALLATION – VEHICLE DETECTION – WITNESS POINT

19.7.1 Detector Loop
Install cable for loop in saw cut in pavement surface.
Minimum depth of cut to be 30 mm, except in zone where axle sensors are to be fitted when minimum depth of cut to be 80 mm as specified.
Width of cut to be 6 mm (+ or - 2 mm).
Provide diagonal cut across each right angled corner as specified.
Provide additional cut from one side of loop to detector pit.
Clean the cuts with compressed air.
Install one loop comprising four turns per cut as specified.
Press the cable to the bottom of the cut using a piece of softwood or similar material.
Ensure the insulation of the cable is not damaged.
Backfill around the cable to the pavement surface with bitumen emulsion such as Pabkote Bitumen Emulsion Type 3 or similar. Backfilling to be undertaken immediately after laying the cable and prior to allowing vehicular traffic. Remove all loose material from the opening immediately prior to backfilling.
Ensure minimum cover of backfill of 20 mm over top of cable, except where axle sensors are to be fitted where minimum cover of filling compound to be 70 mm over top of cable.
Remove excess compound from road surface.
House loop wires in conduit between road and detector pit.
Install and connect loop detector feeder cable between each loop and terminal block in the cabinet.
Ensure one metre of cable is available in the cabinet.
Terminate each loop detector feeder cable to a terminating block.

Witness Point - Provide 24 hours notice to the Superintendent prior to installation of vehicle detector loops. Refer to standard drawing CS 1551 and CS 1552.

19.7.2 Piezo Axle Sensors
Axle sensors and guides will be supplied by the Principal.

AXLE SENSOR GUIDE INSTALLATION
Refer to standard drawing CS 1552.
Cut two slots across the carriageway 60 mm wide (+ or - 2 mm) 50 mm deep (+ 5 mm) with centres of each slot 1.0 m (+ or - 5 mm) apart.
Cut feeder cable slots from the centre line of each slot to the carriageway edge 6 mm wide (+ or - 2 mm) and 25 mm (+ 5 mm) deep.
Prevent ingress of adhesive during installation by covering guide ends, securing screw holes and area between the guide and feeder cable slots with plasticine or similar material.
Cover upper surface of the guides with masking tape or other material to prevent ingress of adhesive.

Insert ten 65 mm square by 10 mm thick foam polystyrene packing pieces into each slot.

Place guides temporarily into slots pressing down until top of guide is flush with road surface.

Remove the guides after polystyrene has deformed leaving the compressed polystyrene in the slots.

Fill the slot to a depth of 20 mm with "Hermetite" epoxy resin or "Epirez 214" or similar.

If the carriageway surface is not level, this may be performed in stages.

Fit the guide into the slot with securing screws downstream of the traffic flow.

Push the guide down to allow the epoxy to flow up the sides of the slot.

Remove excess epoxy from the guide or road surface before it hardens.

Fill any gaps with epoxy.

Place weights on guide to hold it in proper position during curing process.

Install countersunk ‘dynabolt’ fixings in base of guide after curing is complete.

Space the fixing 0.25 m from each end and 0.5 m spacing along the guide.

Drill 10 mm hole through base of guide and 100 mm into road pavement for each fixing.

Countersink and clear each hole.

Pour epoxy into holes and insert 100 x 10 mm ‘dynabolt’ fixings.

Retighten the dynabolts after the epoxy has hardened.

Tighten the batten fixing after epoxy has hardened.

AXLE SENSOR INSTALLATION

Do not flex the Piezo detectors about the x axis shown on drawing C(S) 1552.

Do not remove Piezo detector after installation.

Remove plasticine or similar from guide ends and securing screw holes.

Undo securing screws sufficient to clear the inside of the guide slot.

Clean the guide slot of all foreign material.

Wipe each sensor with liquid soap to ease the sensor into the slot.

Insert sensor tapered side down.

Tap sensor into slot with large faced rubber mallet starting from both ends working to the middle.

Tighten securing screws after sensor has been firmly inserted into slot.

House sensor "tails" in conduit between carriageway and detector pit.

Install and connect Piezo detector feeder cable between each sensor tail and terminal block in the cabinet.

Ensure one metre of cable is available in cabinet.

Fill all cable slots flush with carriageway surface using a bituminous emulsion such as Pabkote Bitumen Emulsion No. 3 or similar.

Remove excess compound from carriageway surface.

19.8 SOLAR POWER SUPPLY

Provide stand off sleeves 16 mm LD electrical conduit or similar.

Mount the solar panel on the sleeves in the tray.

Provide 50 mm clearance from the back of the solar panel to the mounting plate.

Use stainless steel metal thread screws to secure solar panel to mounting plate.

Provide electrical wiring from the solar panel to the cabinet consisting of two wires, one red and one black. Wires to be protected using 16 mm flexible conduit and adaptors between solar panel junction box and solar panel tray.

Wires to be supported to minimise loading on terminals.

Run the wires internal of the post and enter the cabinet through the access hole provided.

Seal the access hole with silicon sealant.

Erect solar panel facing north.

19.9 TESTING AND INSPECTION – WITNESS POINT

19.9.1 General – Witness Point

Witness Point - Test the installation in the presence of the Superintendent.

19.9.2 Detector Loops

Ensure detector loops and loop feeder cables have a minimum insulation resistance of 200 Mohm between the conductors and earth.

19.9.3 Inspection – Witness Point

Witness point - Provide 24 hours notice to the Superintendent for inspection of excavations for foundations and conduits.
20 STREET LIGHTING

20.1 OUTLINE DESCRIPTION

Supply, install, test and commission new street lighting as specified herein and as shown on the drawings.
Modify and replace existing street lighting as specified herein and as shown on the drawings.

20.2 REFERENCED DOCUMENTS

Refer to the following sections:
- EARTHWORKS for excavation and trenching.
- MISCELLANEOUS CONCRETE WORKS for pole footings.

20.3 STANDARDS

Conform to the following Standards and Publications unless specified otherwise:
AS 1742.3 Manual of uniform traffic control devices – Traffic control devices for use on roads.
AS/NZS 1158.1.1 Lighting for roads and public places (Category V) lighting – Performance and design requirements.
AS/NZS 1158.1.3 Road lighting – Vehicular traffic (Category V) Lighting – Guide to design, installation, operation and maintenance.
AS /NZS 3000 Wiring Rules.
PowerWater Corporation
Power Networks Design and Construction Guidelines.
PowerWater Corporation

20.4 MATERIALS

Columns
Requirement: Provide columns in accordance with Power Water Corporation Street Lighting Manual Volume 3, standard drawings, to suit the individual street lighting design requirements.

Erection: Upon erection ensure columns stand vertically, in all directions, under final loading conditions

Foundations and Ragbolt Assemblies
Construct column concrete footings and ragbolt assemblies in accordance with the Power Water Corporation Street Lighting Manual – Volume 3.

Terrain Category:
Columns footings and ragbolt assemblies shall be suitable for the terrain category cyclonic conditions of the area in which they are to be installed.

Luminaires
Provide street light luminaires of the types specified on the drawings.
Install lamps in all luminaires to the sizes and types specified on the drawings.

Control Equipment
Control Panels: Control luminaires via time switch controllers located in nominated substations in underground areas or in distribution pillars or pole mounted control panels in overhead areas.
Control Packs: Provide control switch pack in the base of each pole
In each control pack provide a terminal strip for terminating the active, neutral and earthing conductors, and an automatic circuit breaker.
Size each termination on the terminal strip to readily accommodate three streetlighting conductors without undue bunching.
Protect the street lighting cables with a 10 Amp single pole miniature DIN type automatic circuit breaker with a rated interrupting capacity of 9kA at 240V AC symmetrical.

20.5 EXCAVATION – WITNESS POINT

General
Excavate for footings and trenches as shown on the drawings.

Column footings
Vertically excavate all column footing holes.
Excavate footing holes 150 mm greater than the maximum dimension of the footing. Avoid larger than necessary excavations.
Where necessary carry out pumping to remove ground, storm and/or surface water.
If for any reason, the final hole is larger than required backfill with concrete to the undisturbed soil.
In areas where unripable rock is encountered, and the use of explosives becomes necessary, the depth of excavation may be reduced, subject to acceptance by the Superintendent.
Advise the Superintendent immediately rock is encountered.

**Trenches**
Nominal trench width: 300 mm.
Nominal trench depth: 1000 mm.

**Witness point** – Notify the Superintendent when trench excavation is complete and before backfilling has commenced.

**Existing Services**
Excavate with care when crossing existing underground services. Increase the trench depth to provide a minimum of 150 mm clearance between the lowest part of the service and the first layer of marking tape.
Ramp the trench back from the obstruction.

**20.6 FOOTINGS**

**Concrete**
Supply and place concrete in accordance with the MISCELLANEOUS CONCRETE WORKS Section.

**20.7 BACKFILLING**

**Material**
Backfill with select fill as specified in the EARTHWORKS Section.
Bedding sand: Clean washed river sand.
Provide samples of bedding sand and select fill if requested by the Superintendent.

**Cable Installation**
Carry out backfilling of the trenches in accordance with the following:
- All underground power cables to be enclosed in suitably sized heavy duty orange uPVC underground conduit
- Cover the bottom of the trench with a 50 mm tamped sand bed.
- Lay conduits and earth conductor on the sand bed.
- Top up with sand to form a layer 150 mm minimum over cables.
- Lay the first marker tape.
- Complete the backfilling of the trench with a second marker tape at a depth of 300 mm below finished ground level.

**Cable Marker Tapes**
Lay two cable marker tape strips as follows:
Strip 1: Directly on top of the 150 mm sand bedding.
Strip 2: 300 mm below the finished ground level.

Lay marker tapes with a 600 mm minimum overlap at joins.

**Placing Backfill**
Place backfill in 150 mm maximum layers and compact to 95% MMDD (Maximum Modified Dry Density).

**20.8 INSTALLATION OF LIGHT COLUMNS**
Install light columns, outreaches, lanterns and fittings in accordance with the PowerWater Corporation standard drawings.

**20.9 CONNECTION**
Connect service cables between new street lighting poles in accordance with the design drawings.
Arrange with PowerWater to connect the new street lighting installation to the existing PowerWater Corporation network and pay all associated costs.

**20.10 EXISTING STREET LIGHTING – HOLD POINT**

**Disconnection and removal**
Make safe, disconnect and remove existing wiring.
Dismantle existing street lighting installations, taking care to avoid damage to items during dismantling operations and transport.
Deliver the salvaged materials to a storage shed to be nominated by the Superintendent
Excavate and remove from the site all traces of abandoned concrete footings, hold down bolts and cabling.

**Temporary Lighting - Hold Point**
Provide temporary lighting in accordance with PowerWater Corporation standards at intersections during periods of construction if existing street lighting is removed before new street lighting is installed.
Provide temporary lighting to Category V3 of AS/NZS 1158.1.1 and AS/NZS 1158.1.3.

**Hold point** – Submit plans of the proposed temporary street lighting to the Superintendent for approval prior to removal of existing street lights.
20.11 TESTING AND COMMISSIONING

TESTING: Measure and record in Megohms the insulation resistance between each conductor and earth.
Check continuity of each cable installed.
Check correct phasings of all active cables of the low voltage distribution system.
Check polarity at each street lighting column to ensure that neutral and active cables are not inadvertently interchanged. Incorrect polarity at a street lighting column would result in a live column.
COMMISSIONING: After all the above test results are found satisfactory, arrange for Power Water Corporation to carry out the commissioning work to live up the newly installed low voltage distribution system.

20.12 REINSTATEMENT

Reinstate any damage to roads, footpaths, verges, drainage structures and vehicle driveways to their original condition.
21 DIRECTIONAL(THRUST) BORING

21.1 GENERAL

This section specifies the installation of piping beneath trafficked surfaces, buildings or other nominated areas without trenching, disruption to traffic or subsidence.

21.2 STANDARDS

Conform to the following Standard unless specified otherwise:

AS 1579 Arc welded steel pipes and fittings for water and waste water.

21.3 PROPOSED METHOD – HOLD POINT

Hold point – Submit details of the proposed method of thrust boring not less than 14 days prior to commencement of construction using that method. Include details of proposed filling of cavities. No disruption or excavation of the surface is to take place over the length nominated.

21.3.1 Directional Boring With Pipe Casing

Keep dimensions of jacking pits to the minimum necessary.

Use pipe jacking equipment inspected and approved by the WorkSafe.

Use a welded mild steel pipe casing manufactured in accordance with AS 1579 and of sufficient strength to withstand the forces generated irrespective of the nature of subsurface material encountered.

Ensure the inside diameter of the casing is 50 mm greater than the maximum outside diameter of the pipe joints, skids, cradle runners or other protrusions related to pipe insertion.

21.3.2 Directional Boring Without Pipe Casing

Thrust bore the hole cleanly without projections to a diameter at least 50 mm greater than the maximum outside diameter of the pipe joints, skids or other protrusions related to pipe insertion.

Use plastic skids extending the whole length of the pipe apart from joints to ensure the pipe is at least 10 mm clear of the hole perimeter. Insert the pipe so that the joints are neither stressed nor pulled apart.

21.3.3 Testing

Reference: Refer to the appropriate clause in the Hydraulics Section of the specification for pressure testing of pipes.

21.3.4 Filling of Cavities

Pressure Pipes

Carry out grouting of the pipe/casing cavity with pumped cementitious grout (Class 10 MPa) containing an appropriate plasticising agent. Pipe to be full of water under a pressure equal to normal expected operating pressure.

Non-pressure Pipes

Fill cavities with Type 1 bedding material thoroughly watered in.

Type 1 bedding: Granular material free of clay, dust, fines, salt or organic matter complying with either of the following gradings:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percentage Passing By Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Type 1a</td>
</tr>
<tr>
<td>9.5 mm</td>
<td>100</td>
</tr>
<tr>
<td>6.75 mm</td>
<td>100</td>
</tr>
<tr>
<td>2.36 mm</td>
<td>100</td>
</tr>
<tr>
<td>1.18 mm</td>
<td>95 – 100</td>
</tr>
<tr>
<td>600 um</td>
<td>80 – 100</td>
</tr>
<tr>
<td>300 um</td>

</tr>
<tr>
<td>150 um</td>
<td>0 – 6</td>
</tr>
<tr>
<td>75 um</td>
<td>0 – 6</td>
</tr>
</tbody>
</table>

Linear shrinkage of materials passing a 425 um sieve to be less than 2.5%.
22 MEASUREMENT AND PAYMENT

The following Measurement and Payment clauses refer to the specification sections of the same name, however, the clause numbers do not match the section numbers of the same title.

22.1 MISCELLANEOUS PROVISIONS

22.1.1 Environmental Management
Generally
Not measured separately
Include the cost of environmental management in the rates for the applicable items.
22.1.2 Environmental Management Plan
Measured as an item.
22.1.3 Cleaning of Vehicles and Plant
Measured by number cleaned.
Vehicles and plant items are priced separately.
22.1.4 Establishment
The sum for establishment not to exceed 30 per cent of the Tender Sum.
Mobilisation:
Measured as an item. Not to exceed 10 per cent of the Tender Sum.
Payment when the Contractor established on site.
Demobilisation:
Measured as an item. Payment when demobilisation complete.
Ongoing costs:
Measured as an item. Payment progressively during the contract in proportion to the value of complying work.
22.1.5 Project Notice Boards
Measured by number erected.
22.1.6 As Constructed Information
Include the cost for providing as constructed information and drawings in the negotiated costs for the variation associated with the amendment to the design which led to the need to amend the information and drawings to accurately reflect the as built condition.
22.1.7 Level Checking
Measured in kilometres for the layer under consideration.
22.1.8 Control Station Check Survey
Measured as an item.

22.2 PROVISION FOR TRAFFIC

22.2.1 Traffic Management Plan
Measured as an item. Include in Provision for Traffic. Include TCDs.
22.2.2 Provision for Traffic
Measured as an item.
Includes detours, temporary connections, access to adjacent properties, traffic guidance, traffic control devices, temporary bridging, warning devices, maintenance and restoration.
Variable message boards will be measured as an item.
Payment will be made progressively in proportion to the value of work carried out.
22.2.3 Gravelling of Detours
Measured in square metres for the specified gravel thickness and width.
Make allowance for supply, delivery, and compaction of material.
22.2.4 Sealing of Detours
Measured in square metres for the specified width.
Make allowance for the removal and disposal of seal and restoration work.

22.3 CLEARING GRUBBING AND REHABILITATION

Measured as an item.
Includes removing vegetation stripping and stockpiling, top soil respreading, removal of unrecoverable fencing, drainage structures, old road surfaces and other obstacles.
Make allowance for stripping, stockpiling and respreading of the top layer.
Make allowance for replacement of stripped layer.
22.3.1 Treatment of Existing Sealed Surface
Not measured separately.
22.3.2 Scarifying of Existing Roads
Measured in linear metres.
22.3.3 Mulching
Measured as an item.
Make allowance for mulching demolished vegetation, burying stumps, roots and grasses, stockpiling mulched material, spreading mulch and removing excess mulched

22.4 EARTHWORKS

Measurements are based on natural surface levels prior to stripping.
22.4.1 Earthworks in Cut  
Measured in in-situ cubic metres.  
Volume includes Table Drains.

22.4.2 Rock in Subgrade  
Measured in in-situ cubic metres.  
Payment only for works directed by the Superintendent.  
Payment for excavation will be at a rate to be agreed and payment for filling is at the rate for Select Fill.

22.4.3 Unsuitable Material Below Subgrade Surface other than Rock  
Measured in in-situ cubic metres.  
Payment only for works directed by the Superintendent.  
Payment for excavation is at the rate for Earthworks in Cut and payment for filling is at the rate for Earthworks in Fill.

22.4.4 Earthworks in Fill  
Measured in compacted cubic metres.  
Make allowance for volumes affected by Clearing and Grubbing.

22.4.5 Unsuitable Material Beneath Fill  
Measured in in-situ cubic metres.  
Payment only for works directed by the Superintendent.  
Payment for excavation is at the rate for Earthworks in Cut and payment for filling is at the rate for Earthworks in Fill.

22.4.6 Select Fill  
Measured in compacted cubic metres.  
Payment at a rate to be agreed.

22.4.7 Sand Clay Fill  
Measured in compacted cubic metres.

22.4.8 Preparation and Maintenance of Subgrade Surface  
Measured in square metres.

22.4.9 Stream Diversions  
Measured in in-situ cubic metres for cut and compacted cubic metres for fill.  
Temporary work is not measured.

22.4.10 Levees  
Measured in compacted cubic metres.  
Temporary work is not measured.

22.4.11 Table Drain Offlets  
Measured by number.

22.4.12 Table Drain Blocks  
Measured by number.

22.4.13 Catch Drains  
Measured in linear metres.

22.4.14 Widening of Existing Formation  
Measured in linear metres.

22.4.15 Trim and Compact Unsanded Areas  
Measured in square metres.

22.4.16 Surface Formation  
Measured in linear metres.  
Allow for imported material.

22.4.17 Batter Protection by Grassing  
Measured in square metres.

22.4.18 Bridge Foundation Excavation  
The quantity measured shall be determined by multiplying the dimensioned area of the structure footing by the distance from natural surface to foundation level.  
Make allowance for coffer-dam, shoring and sheeting, pumping.  
Make allowance for excavation beyond measured limits for formwork, shoring and sheeting, pumping, etc.

22.4.19 Bridge Foundation Blinding  
Measured in square metres.

22.4.20 Bridge Foundation Backfilling  
Measured in compacted cubic metres.  
Make allowance for backfill beyond measured limits.

22.4.21 Fill Adjacent to Bridge Structures  
Measured in compacted cubic metres.

22.5 CONFORMANCE TESTING

22.5.1 Conformance Testing  
The Superintendent will pay all conformance testing directly to the Panel Period Contractor selected to perform the conformance tests required under this contract and nominated as the Superintendent’s responsibility.  
If the tests fail the cost of the failed tests will be a negative variation to the contract.  
When testing has been ordered and the site is not ready for testing at the time specified by the Contractor, the Contractor will bear the cost of time and travel incurred by the Panel Period Contractor and the Superintendent, where applicable.  
Where bituminous products are “Non Conforming”, Refer to the Superintendent for requirements if samples are non-conforming
22.5.2 Process Testing
The Contractor is responsible for the ordering up and payment for all process tests carried out. This is not measured separately. Include the cost of process testing under the relevant items in the Schedule of Rates.

22.6 PAVEMENT AND SHOULDERS
Measured in square metres for each specified thickness and material.
Make allowance for pavement or shoulder materials outside the carriageway width not included in measurement.

22.6.1 Reconstruction of Existing Pavements
Measured in linear metres.
Make allowance for variation in pavement thickness and deformation of existing pavement.

22.6.2 Supply to Stockpile
Measured in cubic metres in the stockpile.

22.7 STABILIZATION

22.7.1 Supply and Spread Stabilising Agent
Measured in tonnes.
Determined by multiplying the application rate of cement indicated in the procedure by the area to be treated.
Make allowance for tolerances.

22.7.2 Supply Stabilising Agent
Measured in tonnes.
Determined by multiplying the cement content indicated in the procedure by the dry mass of the plant-mix ordered for stabilisation.
The dry mass is determined by multiplying the plant-mix measured by 98% of the maximum modified dry density.
Make allowance for tolerances.

22.7.3 Supply Materials to be Stabilised
Measured in square metres for each specified thickness.

5.7.9 Mixing, Trimming and Curing

22.7.4 Mixing, Trimming and Curing
Measured in square metres for each specified thickness.

22.7.5 Plant- Mix
Measured in cubic metres.
Determined by multiplying the specified area by the specified compacted depth.
Make allowance for all materials to be stabilised.
Make allowance for curing.

22.8 SPRAY SEALING

22.8.1 Calculation Accuracy
All calculations regarding payment to be to an accuracy of the nearest whole number.

22.8.2 Preparation of Pavement
Measured in square metres of the prepared area.

22.8.3 Prime Coat Enrichment Coat, Emulsion Coat, Primer Seal and Seal Coats
Measured in litres at 15 deg. C. Adjust volumes using the table - BITUMEN EQUIVALENT VOLUMES.
Payment calculated for each spray run. Quantity sprayed is determined by dipping the sprayer tank for each spray run.
Allow for the temperature of the mixture in determining the actual application rate.
The designated volume is determined from the area sprayed and the rate of application indicated in the procedure for such area at 15 deg. C. Multipliers for reducing the volume of hot bitumen to the equivalent volume at 15 deg. C are contained in the table BITUMEN EQUIVALENT VOLUMES.
For primers, enrichment coats, primer seals, polymer modified binder or emulsion seals the rate of application refers to the whole of the mixture.
Allow for adhesion agent in the rate for polymer modified binder.
Tapers are exempt from adjustment tables.
Adjustment to payment for the sprayed volume when the spray application rates equal or exceed 1.0 L/m²:

(i) Application 90% to 95% of the designated volume:
Payment for the sprayed volume less one-half the difference between the sprayed volume and 95% of the designated volume.
(Example: Application = 92% of designated volume.
Pay for (92% - 0.5 x (95% - 92%)) = 90.5% of designated volume.)

(ii) Application 95% to 105% of the designated volume:
Payment for the sprayed volume.

(iii) Application 105% to 115% of the designated volume:
Payment for 105% of the designated volume.
The Contractor must rectify bleeding or flushing seals during the defined defects period where binder application rates...
were applied at > than 105% of the designated volume.

(iv) Application less than 90% or more than 115% of the designated volume will be rejected. Rectify by methods approved by the Superintendent, at the Contractor’s expense.

Adjustment to payment for the sprayed volume when spray application rates below 1.0L/m2:

(v) Application plus 0.1L/m2 and minus 0.1L/m2 of the designated spray rate:
   Payment for the sprayed volume.

(vi) Application rates varying more than 0.1L/m2 of the designated spray rate will result in work being rejected. Rectification will be at the Contractor’s expense by respraying or by other methods approved by the Superintendent.

Payment will be made for the designated volume upon satisfactory rectification of the rejected area at no extra expense to the Principal.

Adjustment to payment for seal coat items (binder, additive, precoat, aggregate) is in accordance with the table PAYMENT ADJUSTMENTS.

22.8.4 Table - Payment Adjustments

<table>
<thead>
<tr>

*Rejected (see note below)

Note: * Rejected - Reseal with materials and methods approved by the Superintendent. Costs incurred from reseal work will be at the Contractor’s expense.

Note: Adjustments are only applied to materials represented by the test sample.

Note: (1) Denotes level of adjustment.

22.8.5 Payment Adjustment Applied to Sub-Contractors
Where:

(a) a payment adjustment is applied against the Contractor under the Contract; and

(b) the Contractor then applies that adjustment to the sub-contractor that carried out the Works the subject of the payment adjustment,

the Contractor will provide the sub-contractor with a copy of the document/s from the Principal that evidence the payment adjustment applied to the Contractor.
22.8.6 Table - Bitumen Equivalent Volumes
Interpolate to determine equivalent volumes at temperatures other than those specified.

<table>

</table>

22.8.7 Additives
Measured in litres at 15 deg. C.
Polymer additives in polymer modified binders not measured separately.
Make allowance for the rates for seal coats.

22.8.8 Precote Applied to Aggregate
Measured in litres.
Make allowance for adhesion agent.

22.8.9 Stockpile Sites
Make allowance for in the relevant rates for sealing aggregate.

22.8.10 Sealing Aggregate
SUPPLY AND DELIVERY
Measured in square metres
APPLICATION OF AGGREGATE
Measured in square metres of finished aggregate work for each size of aggregate.

22.9 DENSE GRADED ASPHALT
22.9.1 New Pavements
Measured in square metres for each specified thickness.
Payments will be determined as per PAYMENT ADJUSTMENTS clause.

22.9.2 Resurfacing Work
Measured in tonne placed as evidenced by weigh bridge dockets.
Payments will be determined as per payment adjustments clause.

22.9.3 Correction Course Work
Measured in tonnes placed as evidenced by weighbridge dockets.
Correction courses are exempt from adjustments for voids.

22.9.4 Payment Adjustments
Rates will be adjusted as follows:

<table>
<thead>
<tr>
<th>Reduction Level</th>
<th>Payment Reduction</th>

### 22.9.5 Progress Claims

Contractor may claim up to three-quarters of the contract rate when works are physically completed on site with balance of payment following conformance test results.

### 22.9.6 Payment Adjustment Applied to Sub-Contractors

Where:

(a) a payment adjustment is applied against the Contractor under the Contract; and

(b) the Contractor then applies that adjustment to the sub-contractor that carried out the Works the subject of the payment adjustment,

The Contractor will provide the subcontractor with a copy of the document/s from the Principal as evidence that the payment adjustment applied to the Contractor.
22.10 **SLURRY SURFACING**

Payment will be made at the tendered rates for the actual quantity of accepted slurry surfacing mix spread.

**Measurement:**
- Slurry surfacing laid per m² @ average 9 mm thickness, including surface preparation and supply and laying of slurry surfacing mix.
- Slurry correction volume per m².

22.11 **MISCELLANEOUS CONCRETE**

Make allowance for excavation, bedding and backfilling in the following items.

22.11.1 **Footpaths**
Measured in linear metres for each type.

22.11.2 **Vehicle Crossings and Access Strips**
Measured in square metres for each type.
Make allowance for reinforcement.

22.11.3 **Kerbs and Gutters**
Measured in linear metres for each type (any drainage structures/crossings excluded from measured lengths.)

22.11.4 **Inverts**
Measured in linear metres.

22.11.5 **Wheelchair Crossings**
Measured by number.

22.11.6 **Traffic Island and Median Infill**
Measured in square metres.

22.12 **DRAINAGE WORKS**

22.12.1 **Excavation in Trenching**
Measured in in-situ cubic metres for the specified range of depths to invert.
The length of the trench shall be measured between the outside face of headwalls or between the centre of pits.
The width of the trench shall be the outside width of the culvert plus 300 mm on each side.
The depth of the trench is the average of the depths to invert measured at the structure at each end of the section.
The depth to invert is the lesser of the depth below natural surface and the depth below finished surface level. In the case of kerbside structures, the finished surface level is measured at the top of kerb.
Make allowance for shoring, bedding, inlet and outlet structures and irregularities in the natural surface where applicable.

22.12.2 **Supply, Load, Transport, Bed, Lay and Backfill Culverts**
Measured in linear metres along the invert of the culvert as the distance between the outside face of headwalls or other structures for the type and size scheduled.
Multiple barrel culverts are measured as the single distance between the outside face of headwalls or other structures.
Excavation is measured separately.

22.12.3 **Excavate, Supply, Load, Transport, Bed, Lay and Backfill Culverts**
Measured in linear metres along the invert of the culvert between the outside face of headwalls/inside face of pits or other structures for the type and size scheduled.
Multiple barrel culverts are measured as the single distance between the outside face of headwalls or other structures.
Make allowance for RC floor slabs for precast box culverts.

22.12.4 **Concrete Headwalls, Maintenance Holes and Other Structures**
Measured in cubic metres.
Measured by number.

22.12.5 **Collar Joints, Bandage Joints, Anchor Blocks and End Caps**
Measured by number.
Make allowance for splay ends.

5.7.10 **Inlet and Outlet Channels**

22.12.6 **T**
Measured in in-situ cubic metres.
Not measured separately for culvert waterways less than 2 square metres in cross-sectional area and channels less than 50 metres long.

22.12.7 **Open Unlined Drains**
Measured in in situ cubic metres.

22.12.8 **Subsoil Drains**
Measured in linear metres.
Make allowance for blocks, headwalls, filter material, geotextiles, and connection to existing drainage system.

22.12.9 **Demolish and Remove Existing Drainage Structures**
Measured as an item.
Make allowance for backfilling.
22.13 PROTECTION WORKS

5.7.11 Geotextile Fabric
22.13.1 T
Measured in square metres of completed area.
Make allowance for supply and placement.
Make allowance for laps and folds.

22.13.2 Stone Pitching
Measured in square metres of the face area.

22.13.3 Grouted Stone Pitching
Measured in square metres of the face area.
Make allowance for weep holes.

22.13.4 Dumped Rock Protection
Measured in cubic metres.

22.13.5 Rubble
Measured in cubic metres.

22.13.6 Gabions
Measured in cubic metres.
Includes the excavation, steel wire mesh box and the stone filling.

22.13.7 Reno Mattresses
Measured in square metres.
Includes the excavation, steel wire mesh box and the stone filling.

22.13.8 Revetment Mattresses
Measured in square metres.

22.13.9 Embankment Protection - Concrete
Measured in square metres of the face area.
Make allowance for weep holes.

22.13.10 Margins
Measured in linear metres.
Make allowance for reinforcement.

22.14 ROAD FURNITURE AND TRAFFIC CONTROL DEVICES

22.14.1 Fencing
Measured in linear metres.
Make allowance for gates which are not measured separately.
Make allowance for clearing of fence lines which is not measured separately.

22.14.2 Guide Posts
Measured by number.
Make allowance for delineators.

22.14.3 Road Signs, Supply and Install
Measured by number of each sign type or classification.

22.14.4 Reinstate/Relocate Existing Road Signs
Measured by number.

22.14.5 Pavement Marking – New Work
The following are measured in linear metres for type of painted line, inclusive of unpainted gaps:
- Continuity line - (single broken).
- Unbroken lane line - (single continuous).
- Broken lane line or separation line - (single).
- Barrier lines both directions - (double continuous longitudinal lines).
- Barrier lines one direction - (double longitudinal lines broken on one side, continuous on the other).
- Edge line - (single continuous).
- No Standing Any Time - (yellow single continuous).
All other markings measured as an item.
Make allowance for the specified spherical glass beads with all markings.
Removal of existing pavement markings measured as an item.

22.14.6 Pavement Marking – Resealing Contracts
The Superintendent will pay for all pavement marking work directly to the Panel Contractor selected to perform the pavement marking work under this contract.
Measurement of completed pavement marking will be done jointly with the reseal contractor, the panel contract linemarker and the Superintendent.
Recording of localities and extent of pavement marking work, including set out prior to line marking activities are measured as an item.
Include all activities required to co-ordinate the pavement marking work.

22.14.7 Raised Retroreflective Pavement Markers
Measured by number for each type.

22.14.8 Flood Gauge Posts
Measured by number.
Make allowance for gauge.

22.14.9 Cattle Grids
Measured by number.
Make allowance for gate.

22.14.10 Steel Beam Guardrail
Measured from centre to centre of end posts in linear metres.
Make allowance for terminals, delineators and fittings.
22.15 LANDSCAPE

22.15.1 Site Preparation
Measured as an item.
Make allowance for any filling and levelling required.

22.15.2 Topsoil
Measured in square metres.
Make allowance for any supply required, and spreading.

22.15.3 Trees, Shrubs and Ground Covers
Measured by number of each type of genus and species.
Make allowance for supply of plants, mulch, fertilisers, excavation of planting holes, and planting.

22.15.4 Irrigation
Measured as an item.
Make allowance for any design requirements, cost of approvals and connection to the water supply, cost of testing, and provision of as constructed drawings.

22.15.5 Grassing
Measured in square metres.
Make allowance for reseeding.

22.15.6 Watering
Measured as an item.
Note that cost of water will be borne by the Superintendent.

22.16 DUCTING AND CONDUITS

22.16.1 Electrical Ducting
Measured in linear metres.
Make allowance for excavation and backfilling trenches, marker tapes, draw wires and kerb markers.

22.16.2 Water Ducting
Measured in linear metres.
Make allowance for excavation and backfilling trenches, marker tapes, draw wires and kerb markers.

22.16.3 Conduit Markers
Measured by number.

22.17 TRAFFIC CONTROL SIGNALS

22.17.1 Supply and Install Pedestals and Footings
Measured by number.

22.17.2 Supply and Install Non-standard Pedestals and Footings
Measured by number.

22.17.3 Supply and Install Vehicle and Pedestrian Signal Lanterns
Measured by number.
Make allowance for terminal assembly, target boards, cowls and louvres, and all ancillary items.

22.17.4 Install and Commission Controller
Measured as an item.
Make allowance for all ancillary items such as surge reduction filter and earth stake.

22.17.5 Supply, Install and Test Multicore Connecting Cable and Detector Feeder Cables
Measured in linear metres.

22.17.6 Supply and Install Detector Loops
Measured by number.

22.17.7 Provision of Power Connection
Measured as an item.

22.17.8 Supply and Install Conduits
Measured in linear metres.
Make allowance for draw wires, end caps, and ancillary items.

22.17.9 Supply and Install Conduit Junction Pits
Measured by number.

22.17.10 Supply and Install Detector Pits
Measured by number.

22.17.11 Supply and Install Pedestrian Push Button and Audio-tactile Assemblies
Measured by number.

22.17.12 Supply and Install Communications Isolation Pillar
Measured as an item.

22.17.13 Documents and Plans
Measured as an item.
22.18 TRAFFIC COUNTING STATIONS

22.18.1 Install Cabinet
Measured as an item.
Make allowance for supply and installation of terminal blocks and switchboard.
Make allowance for drawing of labelled loop layout and terminal blocks.

22.18.2 Construction of Pole Foundation
Measured as an item.
Make allowance for excavation, reinforcement and rag bolts.

22.18.3 Supply and Install Vehicle Loop Detectors
Measured by number.
Make allowance for cutting, install cable, junction boxes and detector feeder cables.

22.18.4 Install Piezo Axle Sensors
Measured by number.
Make allowance for supply and installation of feeder cables.

22.18.5 Install Pole Assembly
Measured as an item.
Make allowance for installation of solar power supply.

22.18.6 Supply and Install Conduits
Measured by length.
Make allowance for excavation, ducting, reinstatement and connections.

22.19 STREET LIGHTING

22.19.1 Install Light Columns
Measured by number.
Make allowance for installation of street lighting columns including the following:
- trenching and installation of cables including marker tape and backfilling;
- supply and installation of footings and hold down bolts;
- installation of distribution pillars;
- connections; and
- testing and commissioning.

22.19.2 Supply and Install Conduits
Measured in metres.
Make allowance for draw wires, end caps and ancillary items.
Cable installation is paid for in the “Install Light Columns” item.

22.19.3 Removal of Existing Street Lighting
Measured by number.
Make allowance for removal of existing footings and the delivery of the salvaged materials to the specified location.

22.19.4 Provision of Temporary Lighting
Measured as an item.
Make allowance for temporary lighting and additional work required by PowerWater.

22.19.5 Connection of Power
Measured as an item.
Make allowance for fees and charges and additional work required by PowerWater.

22.20 DIRECTIONAL (THRUST) BORING

22.20.1 Directional Boring With Pipe Casing
Measured in linear metres.
Includes supply of pipe casing and filling of cavities.

22.20.2 Directional Boring Without Pipe Casing
Measured in linear metres.
Includes filling of cavities.
